Checking Engine Oil

1. Position a vehicle on a level surface.
2. Turn off the engine.

NOTE: If a vehicle that has not been used for a prolonged period, run the engine for several minutes.
Turn off the engine and wait for 5 minutes at least, and then check the oil level.

3. Check that the engine oil level is within the level range indicated on the oil dipstick. If the oil level is found to have fallen to the lower limit (the "L" mark), refill to the "F" mark.

NOTE: When refilling, use the proper grade of engine oil.

4. Check that the oil is not dirty or mixed with coolant or gasoline and it has the proper viscosity.

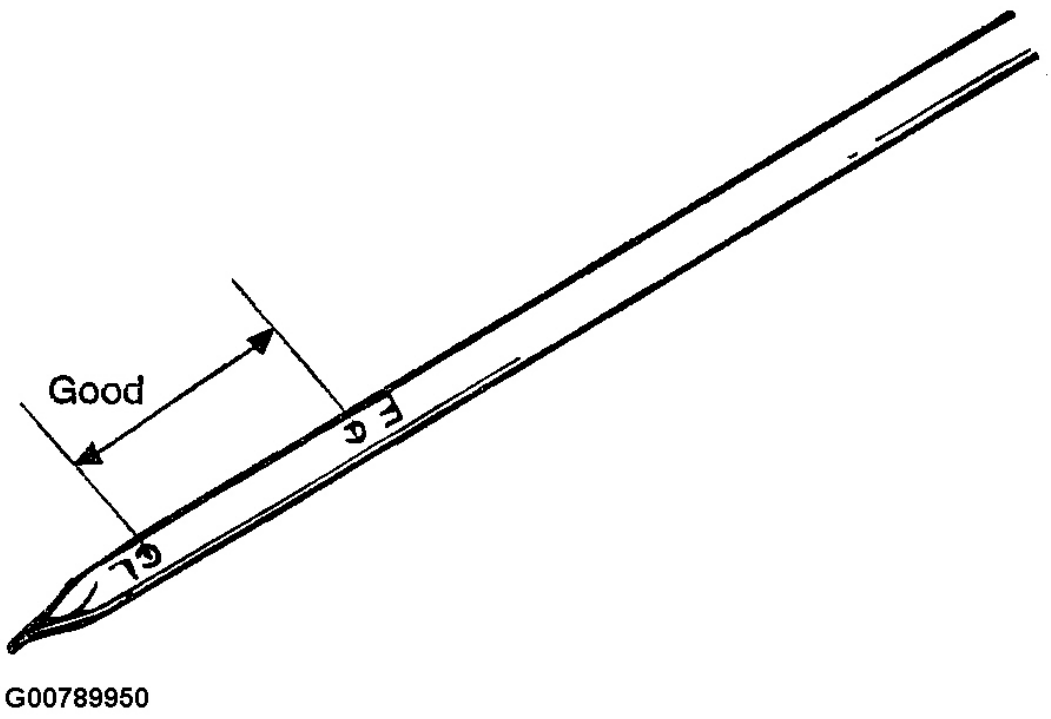

Fig. 6: Identifying Good Oil Level
Courtesy of HYUNDAI MOTOR CO.

Selection Of Engine Oil

Recommended API classification: SH OR ABOVE

RECOMMENDED SAE VISCOSITY GRADES :

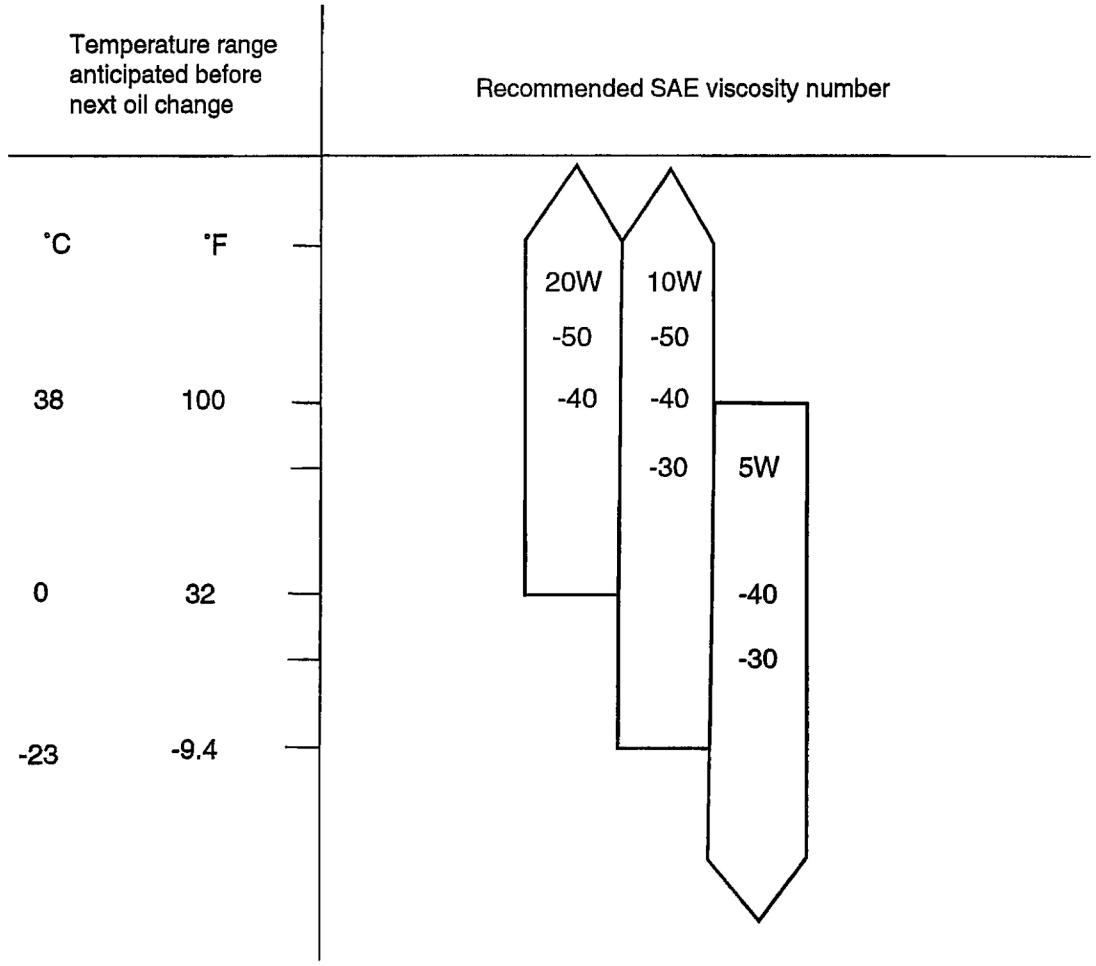

Fig. 7: Recommended SAE Viscosity Grades
Courtesy of HYUNDAI MOTOR CO.

NOTE: For best performance and maximum protection of all types of operation, select only those lubricants which:

1. **Satisfy the requirements of the API classification.**
2. **Have the proper SAE grade number for expected ambient temperature range.**

Lubricants which do not have both SAE grade number and an API service classification on the container should not be used.

Changing Engine Oil

1. Run the engine until it reaches normal operating temperature.

2. Turn off the engine.
3. Remove the oil filler cap and the drain plug. Drain the engine oil.
4. Tighten the drain plug to the specified torque.

   Tightening torque

   Oil pan drain plug : 35 ~ 45 Nm (350 ~ 450 kg.cm, 25 ~ 33 lb.ft)

   NOTE: Whenever tightening the oil drain plug, use a new drain plug gasket.

5. Fill new engine oil through the oil filler cap opening.

   Capacity

   Drain and refill : 4.3 lit (4.53 U.S.qts., 3.78 lmp.qts.)

   NOTE: Do not overfill. This will cause oil aeration and loss of oil pressure.

6. Install the oil filler cap.
7. Start and run the engine.
8. Turn off the engine and then check the oil level. Add oil if necessary.

Replacing The Oil Filter

All Hyundai Motor Company engines are equipped with a high quality, disposable oil filter. This filter is recommended as a replacement filter for all vehicles. The quality of after market replacement filters very considerably.

High quality replacement filters should be used to assure the most efficient service. Make sure that the rubber gasket from the old oil filter is completely removed from the contact surface on the engine block before installing a new filter.

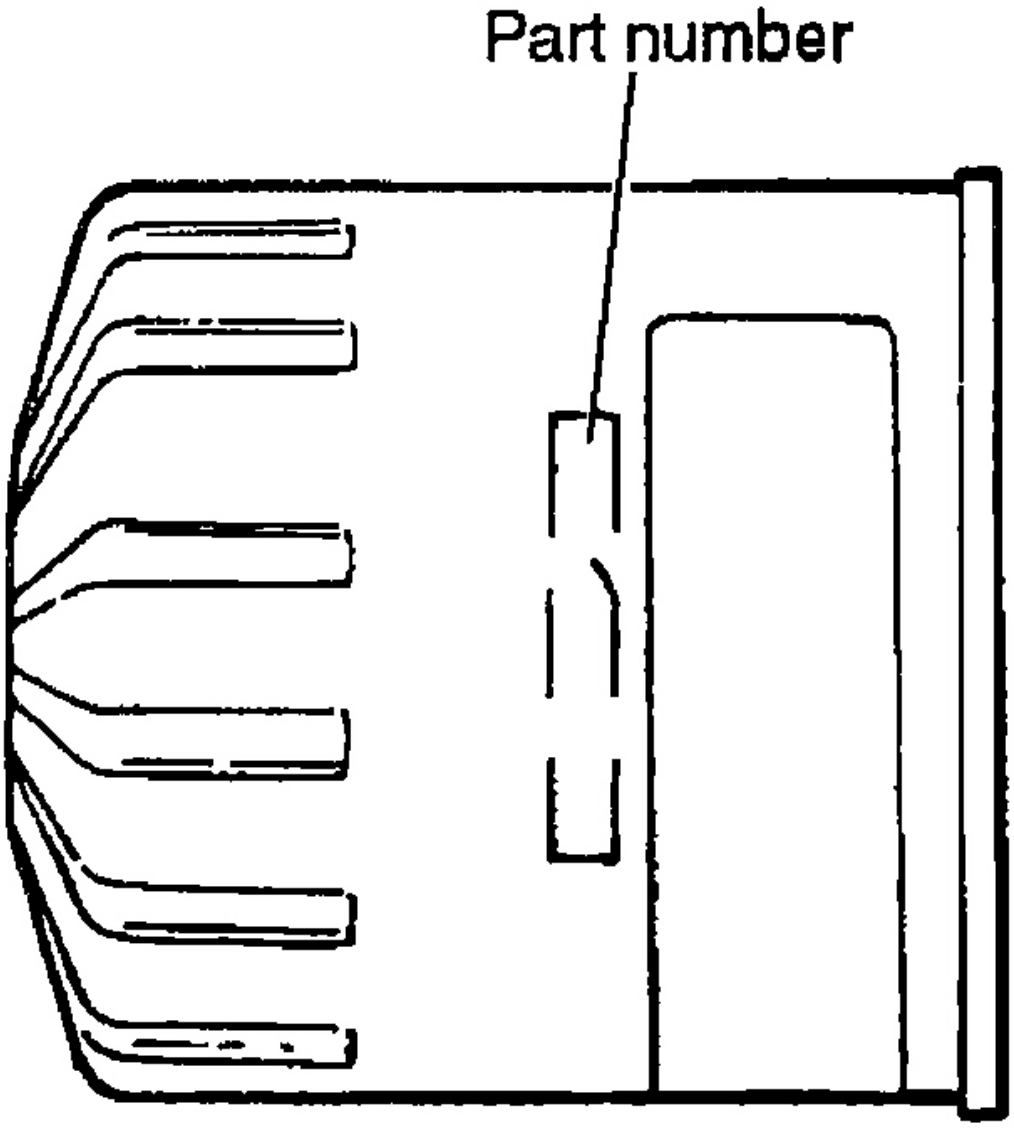

Fig. 8: Identifying Oil Filter Part Number
Courtesy of HYUNDAI MOTOR CO.

Procedure For Replacing The Oil Filter

1. Use a filter wrench to remove the oil filter.
2. Before installing a new oil filter on the engine, apply clean engine oil to the surface of the rubber gasket.

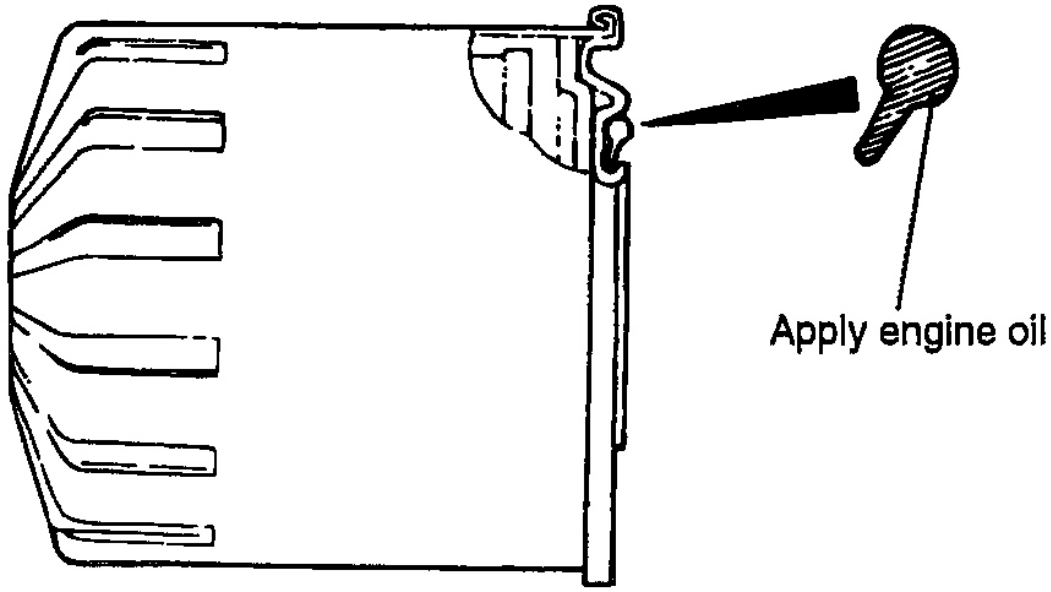

Fig. 9: Applying Engine Oil To Oil Filter Rubber Gasket
Courtesy of HYUNDAI MOTOR CO.

3. Tighten the oil filter to the specified torque.

   Oil filter : 12 ~ 16 Nm (120 ~ 160 kg.cm, 9 ~ 12 lb.ft)

4. Start and run the engine and check for engine oil leak.
5. After turning off the engine, check the oil level and add oil as necessary.

Checking Coolant Leak

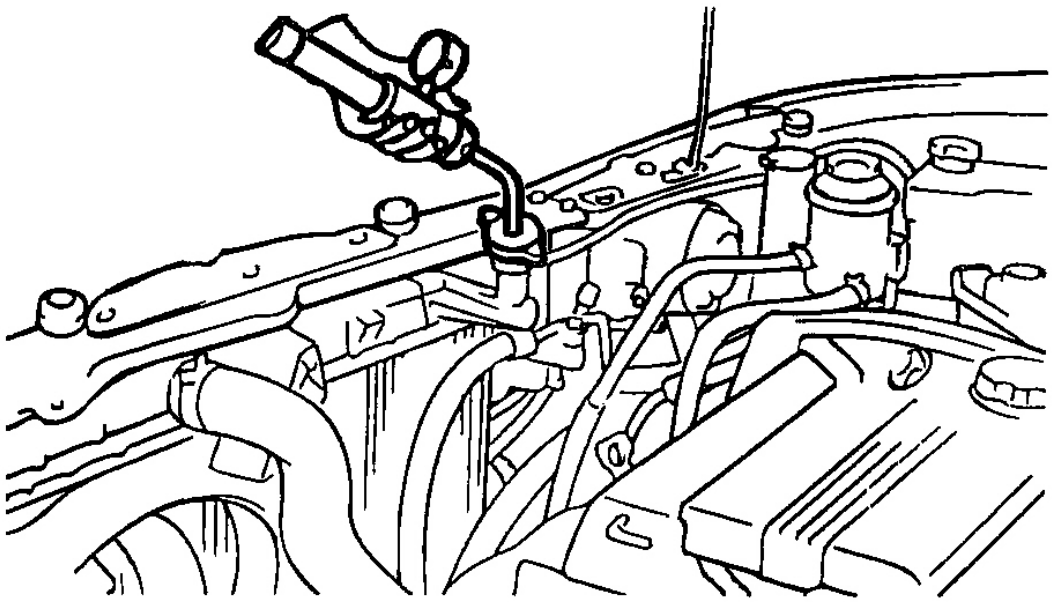
1. Loosen the radiator cap.
2. Confirm that the coolant level is up to the filler neck.
3. Install a radiator cap tester to the radiator filler neck and apply 150 kpa (21 psi, 1.53 kg/cm^2) pressure. Hold it for two minutes in that condition while checking for leakage from the radiator, hoses or connections.

NOTE:

1. **Radiator coolant may be extremely hot. Do not open the system because hot, or scalding water could gush out causing personal injury. Allow the vehicle to cool before servicing this system.**
2. **When the tester is removed, be careful not to spill any coolant from it.**

3. **Be sure to clean away completely any from the area.**
4. **Be careful when installing and removing the tester and when testing, not to deform the filler neck of the radiator.**

4. If there is leakage, repair or replace with the appropriate part.



G00789954

Fig. 10: Pressure Testing Cooling System
Courtesy of HYUNDAI MOTOR CO.

Radiator Cap Pressure Test

1. Use an adapter to attach the cap to the tester.
2. Increase the pressure until the gauge stops moving.

   Main valve opening pressure : 107.9kPa+/-14.7kPa (1.1 +/- 0.15 kg/cm^2 , 15.64 +/- 2.13)

   Main valve closing pressure : 83.4 kPa (0.85 kg/cm^2 , 12.1 psi)

3. Check that the pressure level is maintained at or above the limit.
4. Replace the radiator cap if the reading does not remain at or above the limit.

NOTE: Be sure that the cap is clean before testing, since rust or other foreign

material on the cap seal will cause an incorrect reading.

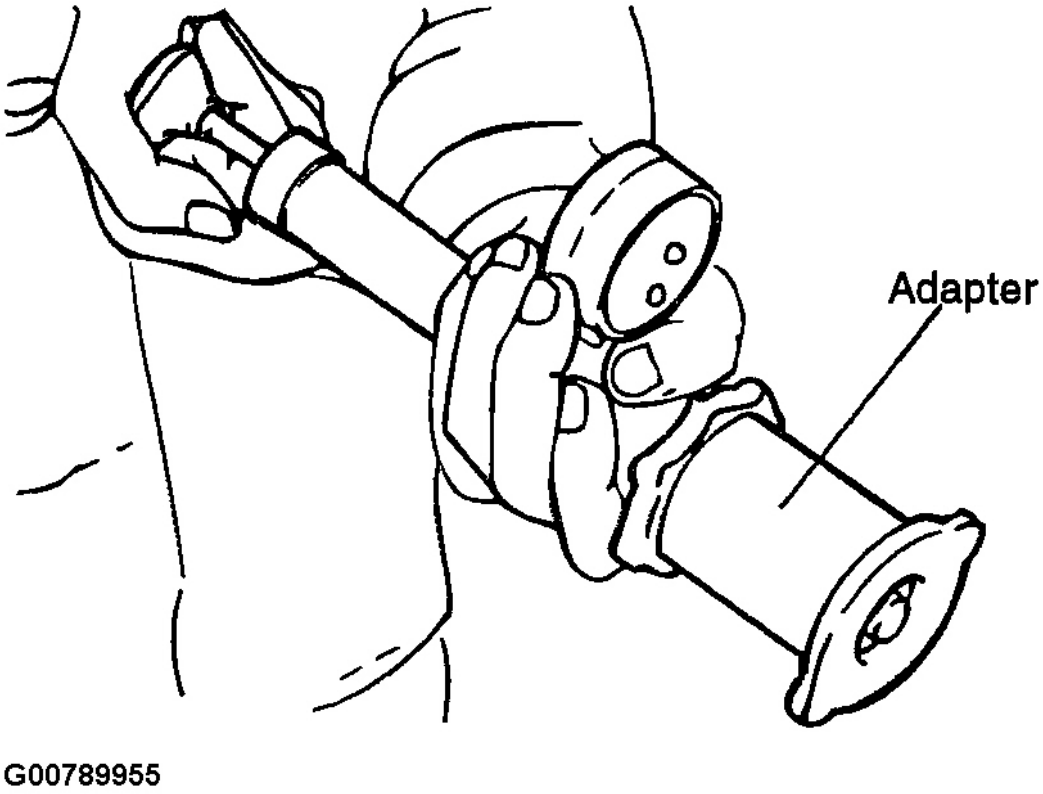


Fig. 11: Pressure Testing Radiator Cap

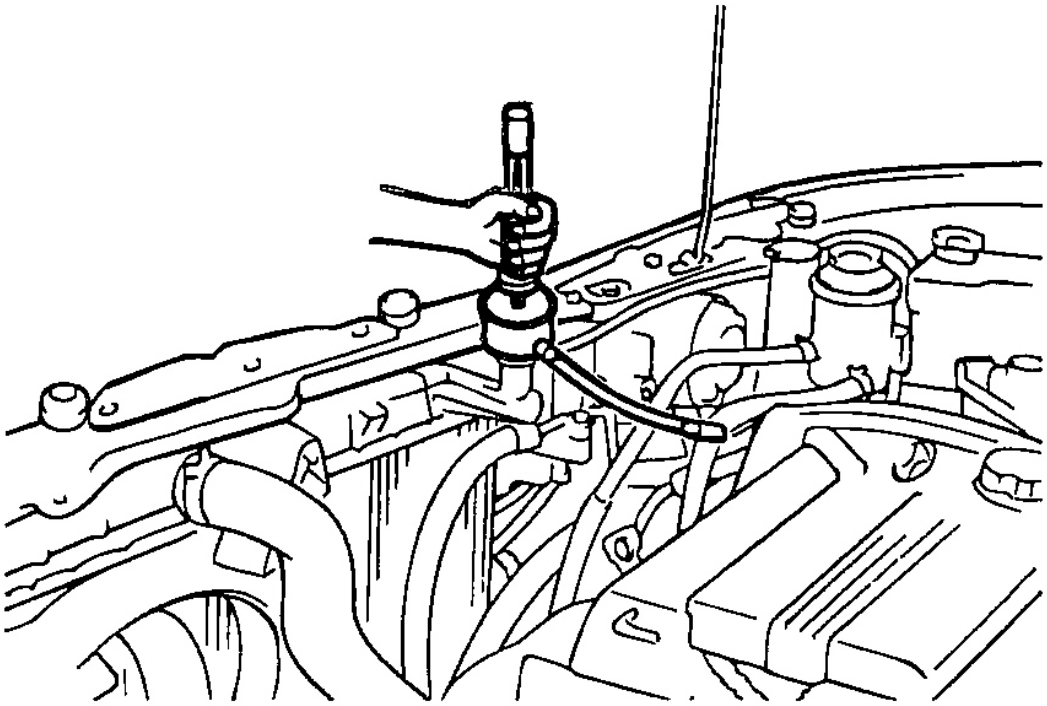
Specific Gravity Test

1. Measure the specific gravity of the coolant with a hydrometer.
2. Measure the coolant temperature and calculate the concentration from the relation between the specific gravity and temperature, using the following table for reference.



G00789956

Fig. 12: Checking Coolant With Hydrometer

Example

The safe operating temperature is -15°C (5°F) when the measured specific gravity is 1.058 at coolant temperature of 20°C (68°F)

CAUTION:

- **If the concentration of the coolant is below 30%, its anti-corrosion properties will be adversely affected.**
- **If the concentration is above 60%, both the anti-freeze and engine cooling property will decrease, affecting the engine adversely. For these reasons, be sure to maintain the concentration level within the specified range.**
- **Do not mix types of anti-freeze.**

Antifreeze	Mxture ratio of anti freeze in coolant

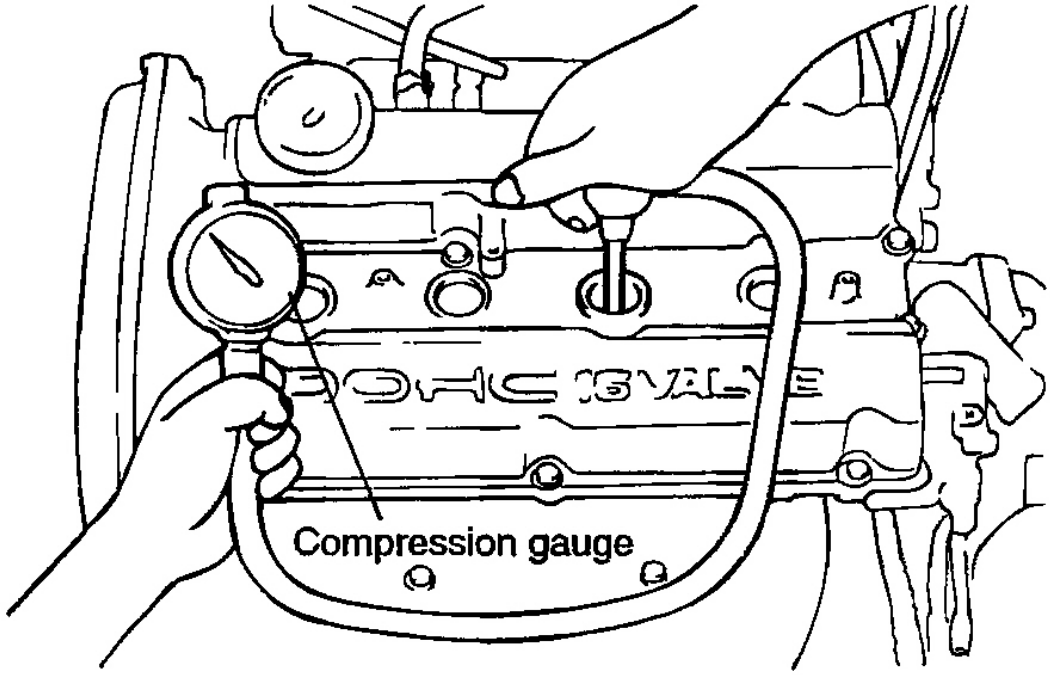
Checking Compression Pressure

1. Before checking engine compression, check the engine oil level. Also check that the starter motor and battery are all in normal operating condition.
2. Start the engine and wait until the engine coolant temperature reaches 80 ~ 95°C (176 ~ 205°F).
3. Turn off the engine and disconnect the spark plug cables.
4. Remove the spark plugs.
5. Crank the engine to remove any foreign material in the cylinders.
6. Insert the compression gauge into the spark plug hole.
7. Depress the accelerator pedal to open the throttle fully.
8. Crank the engine and read the gauge.

   Standard value : 1200 kpa (12.2 kg / cm^2 , 170 psi)



G00789959

Fig. 15: Reading Compression Gauge
Courtesy of HYUNDAI MOTOR CO.

9. Repeat steps 6 to 8 for all cylinders, ensuring that the pressure difference for each of the cylinders is within the specified limit.

   Limit

   Max. 100 kpa (1.0 kg / cm^2 , 14 psi) between cylinder

10. If a cylinder's compression or pressure differential is outside the specification, add a small amount of oil through the spark plug hole, and repeat steps 6 to 9.
    1. If the addition of oil causes the compression to rise, it is likely that there may be wear between the piston ring and cylinder wall.
    2. If compression remains the same, valve seizure, poor valve seating or a compression leak from the cylinder head gasket are all possible causes.

Tightening torque

Spark plug : 20 ~ 30 Nm (200 ~ 300 kg.cm, 14 ~ 22 lb.ft)

Adjusting Drive Belt Tension

1. Check that the belts are not damaged and are properly placed for the pulley grooves.
2. Apply 100 N (22 lbs.) force to the back and midway portion of the belt between the pulleys as shown in the illustration and measure the amount of deflection with a tension gauge.

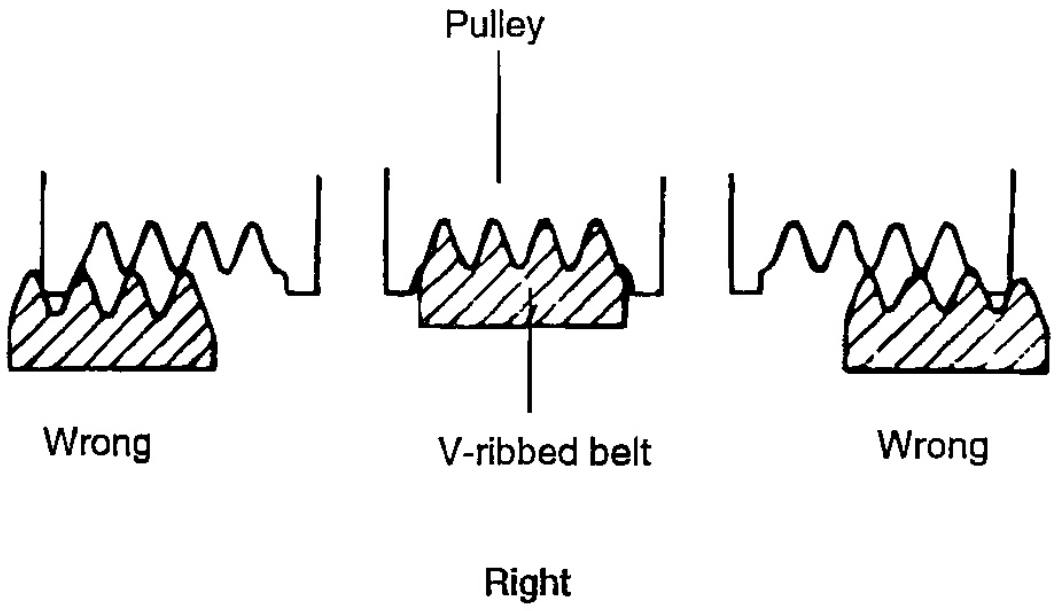


Fig. 16: Locating Belt On Pulley
Courtesy of HYUNDAI MOTOR CO.

CAUTION:
1. **When installing the V-ribbed belt, check that the V-ribs are properly aligned.**
2. **If noise or slippage is detected, check the belt for wear, damage, or breakage on the pulley contact surface, and check the pulley for scoring. Also check the amount that the belt is deflected.**

Items		Inspection	Adjustment	
			New	Use
For alternator	Deflection mm (in.)	7.7 ~ 12.3 (0.303 ~ 0.484)	6.3 ~ 7.3 (0.248 ~ 0.287)	8.4 ~ 10.6 (0.330 ~ 0.417)
	Tension N (lb)	300 ~ 500 (67 ~ 112)	550 ~ 650 (124 ~ 146)	350 ~ 450 (79 ~ 101)
For air conditioner	Deflection mm (in.)	8 (0.31)	5.0 ~ 5.5 (0.20 ~ 0.22)	6.0 ~ 7.0 (0.24 ~ 0.28)
	Tension N (lb)	250 ~ 500 (56 ~ 112)	470 ~ 570 (106 ~ 128)	320 ~ 400 (72 ~ 90)
For power steering	Deflection mm (in.)	6.0 ~ 9.0 (0.24 ~ 0.35)	-	-

G00789961

Fig. 17: Standard Value Table

NOTE:

1. **The belt tension must be measured half-way between the specified pulleys.**
2. **When a new belt is installed, adjust the tension to the central value of the standard range indicated under "New" in the above table. Let the engine idle for 5 minutes or more, and check the standard value indicated under "inspection.".**
3. **When adjusting a belt which has been used, or a belt installed newly after 5 minutes or more of operation, refer to the standard value indicated under "Used" in Fig. 17.**
4. **Refer to the standard value indicated under "Inspection" for periodic inspections.**

Type A Tension Gauge

Do not let the dial section of the tension gauge contact other objects during measurement.

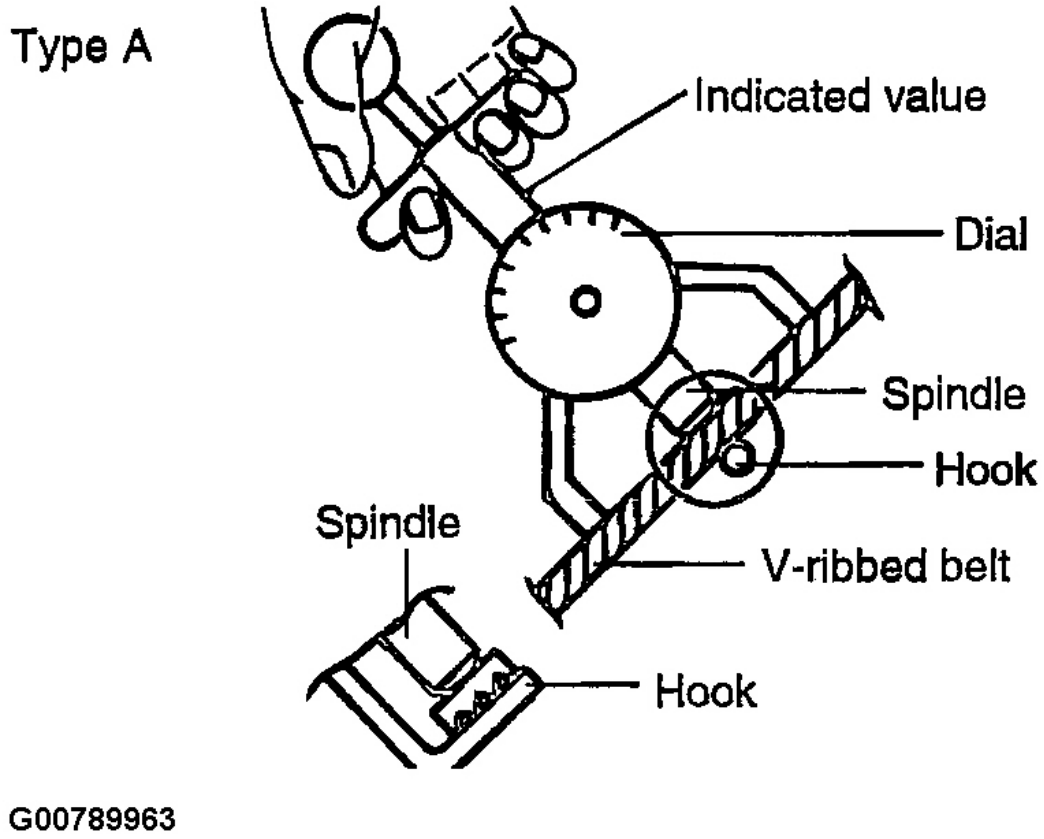

Fig. 19: Identifying Type A Tension Gauge

Type B Tension Gauge

1. When measuring, turn the reset button in the direction of the arrow and set the gauge needle to the RESET position.
2. If the tension gauge is removed from the belt, the needle will still indicate the tension. Read the tension value after removing the gauge.

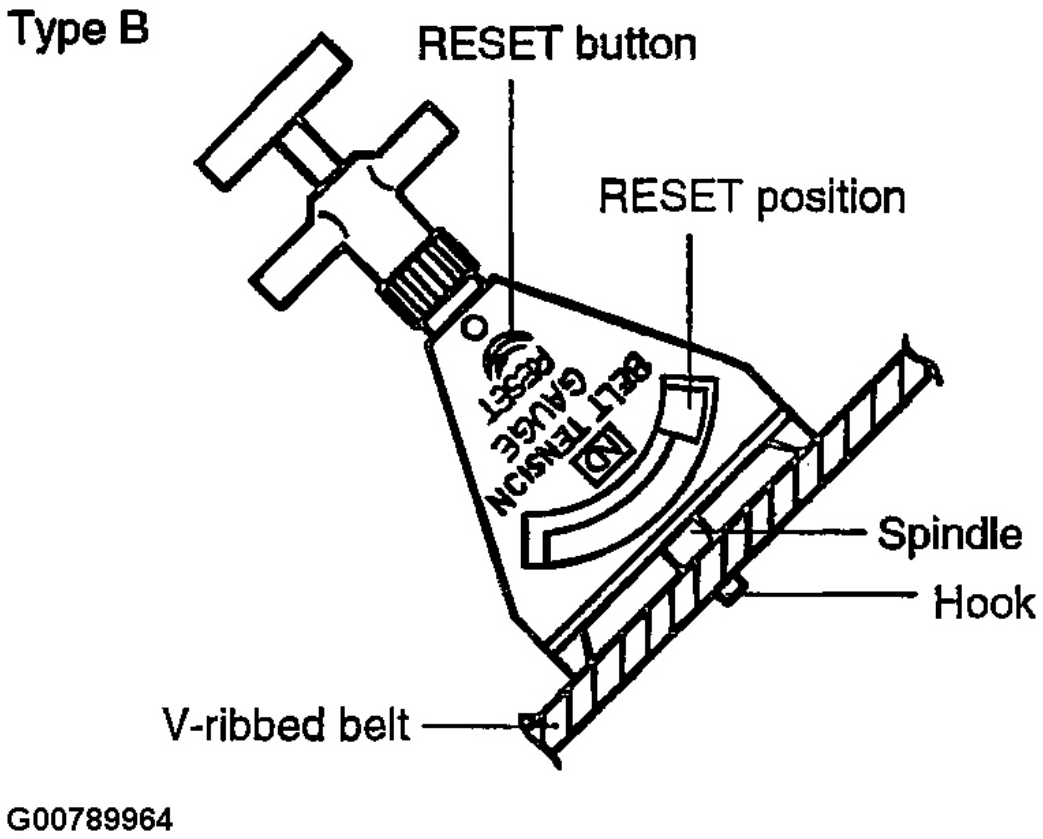

Fig. 20: Identifying Type B Tension Gauge

ADJUSTING THE ALTERNATOR BELT

CAUTION: If the belt is too loose, it will cause noise or sudden wear. If the belt is too tight, the engine coolant pump bearing or the alternator can be damaged.

1. Loosen the alternator nut "A" and the tension adjuster lock bolt "B".
2. Using the tension adjuster bolt, adjust the belt tension to the specification.
3. Tighten the adjuster lock bolt "B".
4. Tighten the alternator nut "A".
5. Check the tension or the deflection of belt, and read just if necessary.

Tightening torque

Alternator nut A :

35 ~ 55 Nm (350 ~ 550 kg.cm, 25 ~ 40 lb.ft)

Adjuster lock bolt B :

20 ~ 25 Nm (200 ~ 250 kg.cm, 14 ~ 18 lb.ft)

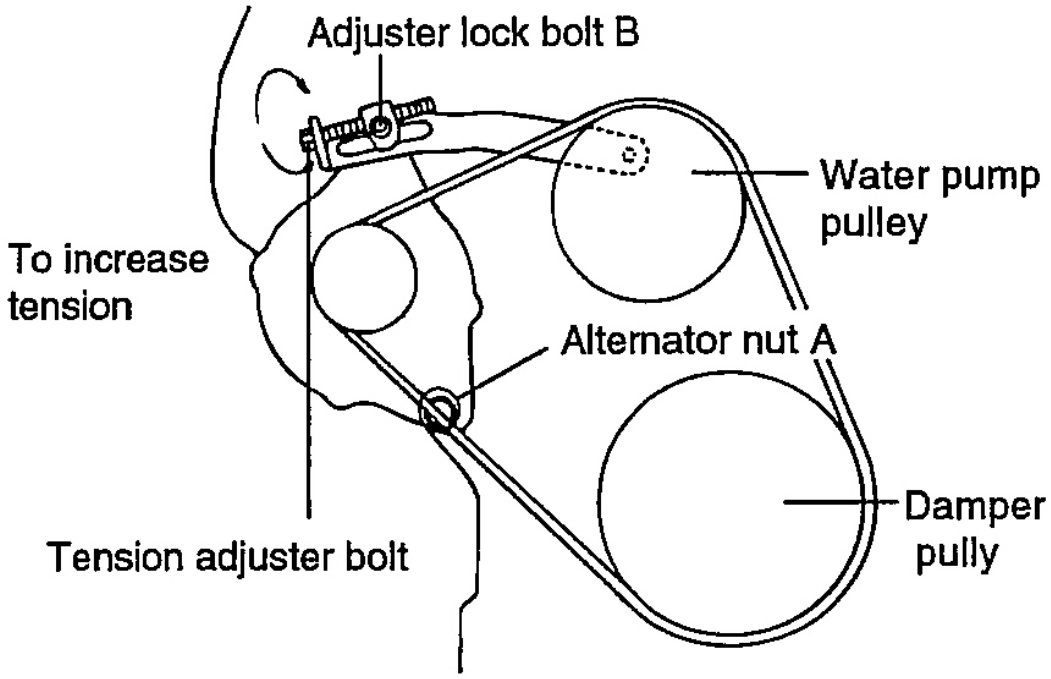

Fig. 21: Identifying Alternator Belt Tensioner Bolt

Adjusting Power Steering & Air Conditioner Belts

1. Loosen the tension pulley adjustment bolt A.
2. Adjust the belt deflection with adjustment bolt B.
3. Tighten bolt A.
4. Recheck the belt deflection and readjust, if necessary.

NOTE: Before rechecking, crank the engine one more revolution.

ENGINE BLOCK

ENGINE BLOCK

Components

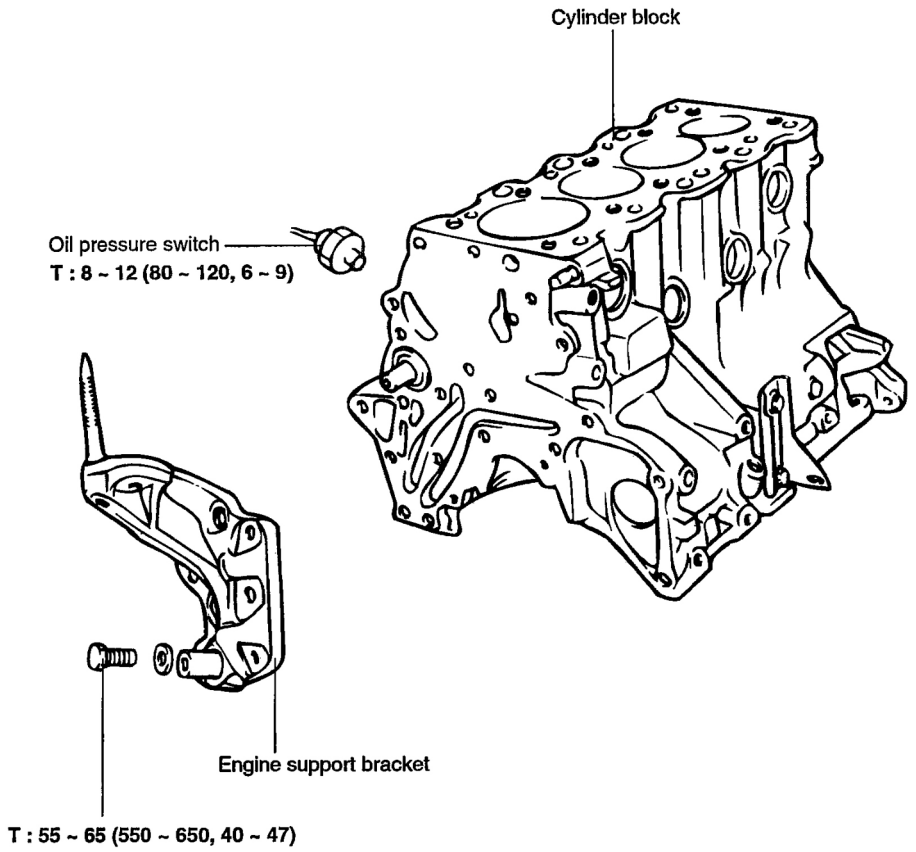

Fig. 28: Engine Block Components
Courtesy of HYUNDAI MOTOR CO.

Disassembly

Remove the following :

- Cylinder head. See **CYLINDER HEAD**.
- Timing belt. See **TIMING BELT**.
- Front case. See **FRONT CASE**.
- Flywheel.
- Pistons. See **PISTON**.
- Crankshaft. See **CRANKSHAFT**.

Inspection

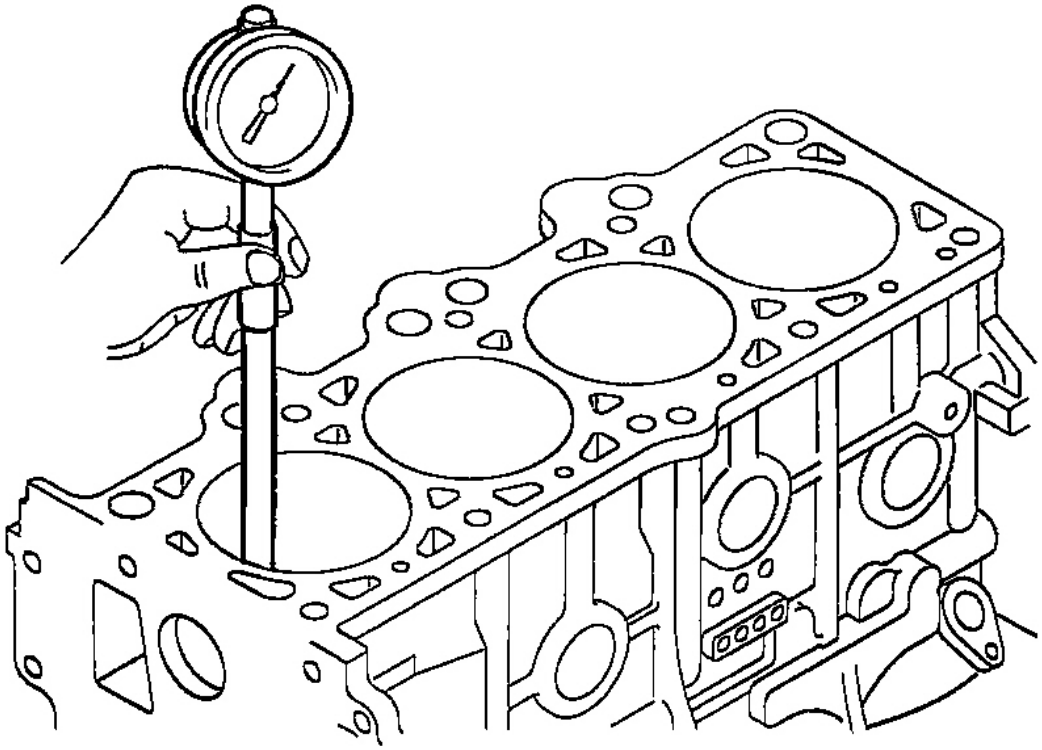
1. Check the cylinder block for scores, rust and corrosion. Also check for cracks or any other defects. Replace the block if defective.

2. Measure the cylinder bore with a cylinder gauge at the three levels indicated and in the directions of A and B.

   Level 1: No. 1 piston ring position at TDC

   Level 2 : Center of cylinder

   Level 3 : Bottom of cylinder



G00789973

Fig. 29: Measuring The Cylinder Bore
Courtesy of HYUNDAI MOTOR CO.

3. If the cylinder bores show more than specified out-of-round or taper, or if the cylinder walls are badly scuffed or scored, the cylinder block should be rebored and honed. New oversize piston and rings should be installed.

   Standard value

   Cylinder bore : 86.5 + 0.03 mm (3.41 + 0.0012 in.)

Out - of - round and taper of cylinder bore :

Max. 0.01 mm (0.0004 in.)

4. If a ridge exists at the top of the cylinder, cut it away with a ridge reamer.

   Piston service size and mark mm (in.)

   Identification Mark : 25

   Size : 0.25 (0.010) O.S.

5. To rebore the cylinder bore to oversize, maintain the specified clearance between the oversize piston and the bore, and make sure that all pistons used are of the same oversize. The standard measurement of the piston outside diameter is taken at a level 16 mm (0.63 in.) from the center of pin hole and across the thrust faces.

   Piston - to - cylinder clearance

   0.02 ~ 0.04 mm (0.0008 ~ 0.0016 in)

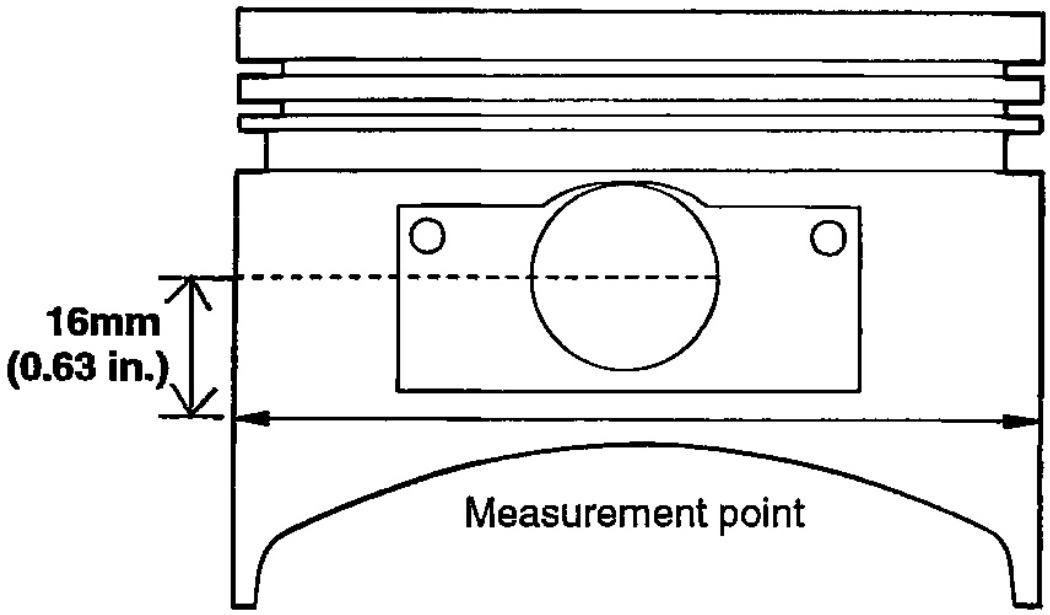


Fig. 30: Measuring Point On Piston Skirt
Courtesy of HYUNDAI MOTOR CO.

6. Check for damage and cracks.
7. Check the top surface of the cylinder block for flatness. If the top surface exceeds limits, surface to minimum limit or replace.

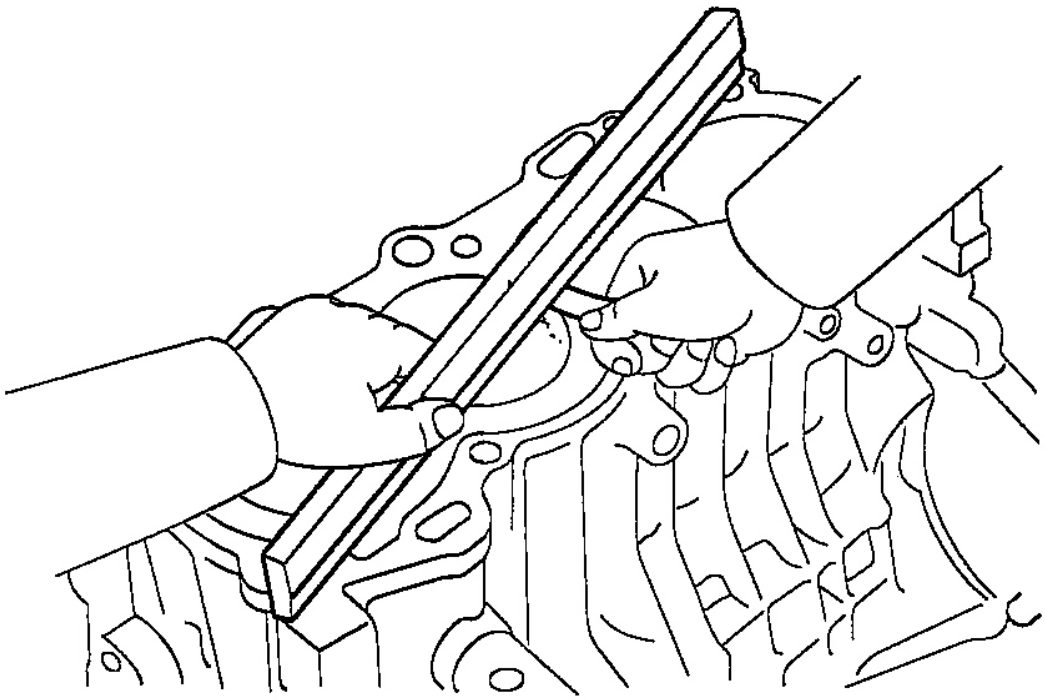
Standard value

Flatness of cylinder block : Max. 0.05mm (0.0020 in.)

Service limit

Flatness of cylinder block: 0.1 mm (0.0039 in.)

NOTE: When the cylinder head is assembled, grinding less than 0.2 mm (0.008 in.) is permissible.



G00789975

Fig. 31: Checking Top Surface Of Cylinder Block
Courtesy of HYUNDAI MOTOR CO.

Boring Cylinder

1. Oversize pistons should be selected according to the largest cylinder bore.

Identification Mark : 25

Size : 0.25 mm (0.010 in.) O.S.

NOTE: The size of a piston is stamped on top of the piston.

2. Measure the outside diameter of the piston to be used.
3. On the basis of the measured O.D., calculate the new bore size.

   New bore size = Piston O.D + 0.02 to 0.04 mm (0.0008 to 0.0016 in.) (clearance between piston and cylinder) - 0.02 mm (0.0008 in.) (honing margin.)

4. Bore each of cylinders to the calculated size.

NOTE: To prevent distortion that may result from temperature rise during honing, bore the cylinders, holes in the firing order sequence.

5. Hone the cylinders, finishing them to the proper dimension (piston outside diameter + gap with cylinder).
6. Verify the clearance between the piston and cylinder.

NOTE: When boring cylinders, finish all four cylinders to the same oversize. Do not bore only one cylinder to the oversize.

Reassembly

Install the following parts by referring to their respective paragraphs.

1. Crankshaft
2. Flywheel
3. Piston
4. Cylinder head
5. Timing belt train
6. Front case

4. Drain the engine coolant.
5. For a vehicle with automatic transaxles, disconnect the transaxle oil cooler hoses.

NOTE: When disconnecting hoses, make identification marks to avoid making any mistake when installing them again.

CAUTION: Be careful not to spill any of oil or fluid out of the hoses. Plug the openings to prevent the entry of foreign material.

6. Disconnect the radiator upper and lower hoses on the engine side then remove the radiator assembly.

7. To install all of parts, follow the removal procedures in the reverse order.
8. Refill the coolant and then check for leaks.
9. Refill the transaxle oil and check for leaks, then test its operation.
10. Check the operation of the transaxle control cable and accelerator cable.
11. Check the proper operation of each gauge.

FRONT CASE

Components

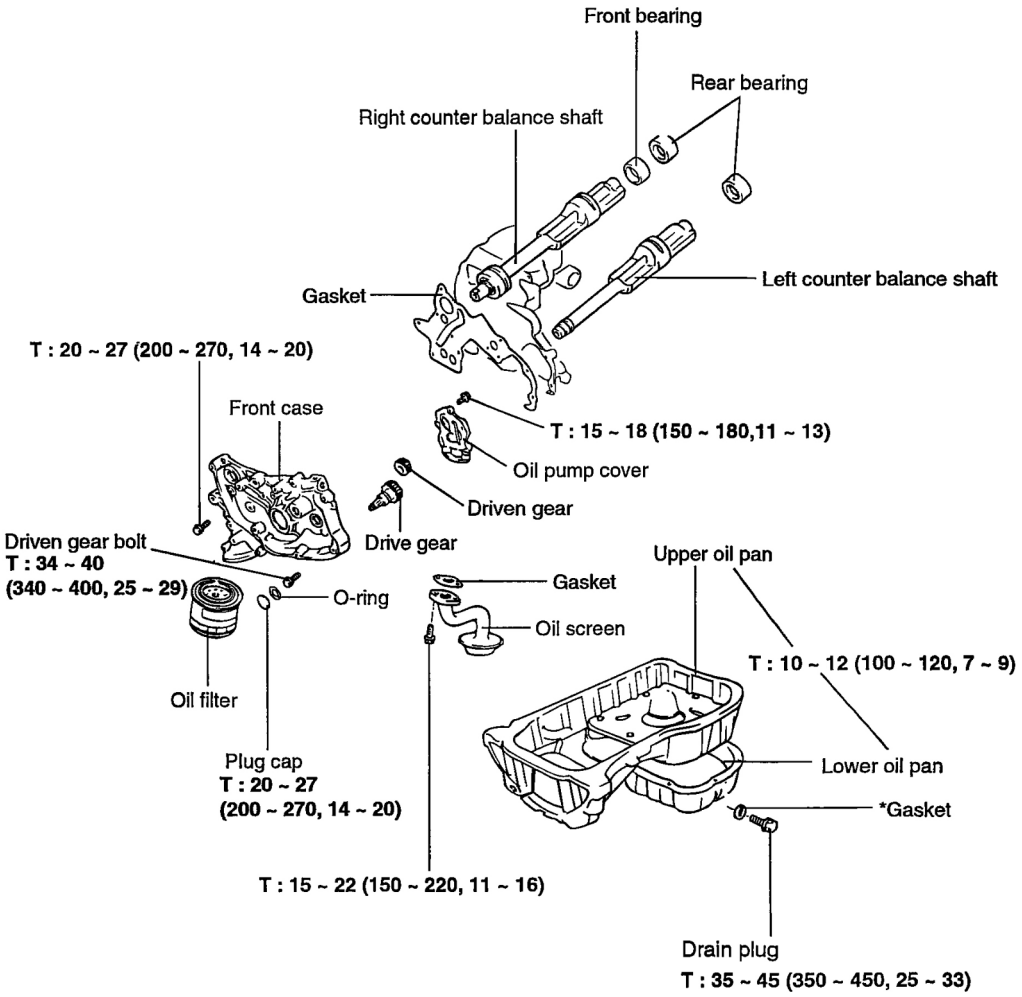

Fig. 63: Front Case Components

Disassembly

1. Remove the timing belt. Refer to **TIMING BELT**.
2. Remove all the oil pan bolts.
3. Tap the oil pan with a rubber hammer and remove the pan. (upper and lower parts)
4. Remove the oil screen and gasket.
5. Remove the front case assembly.

6. Remove the oil pressure switch.

14. Remove the screw driver.

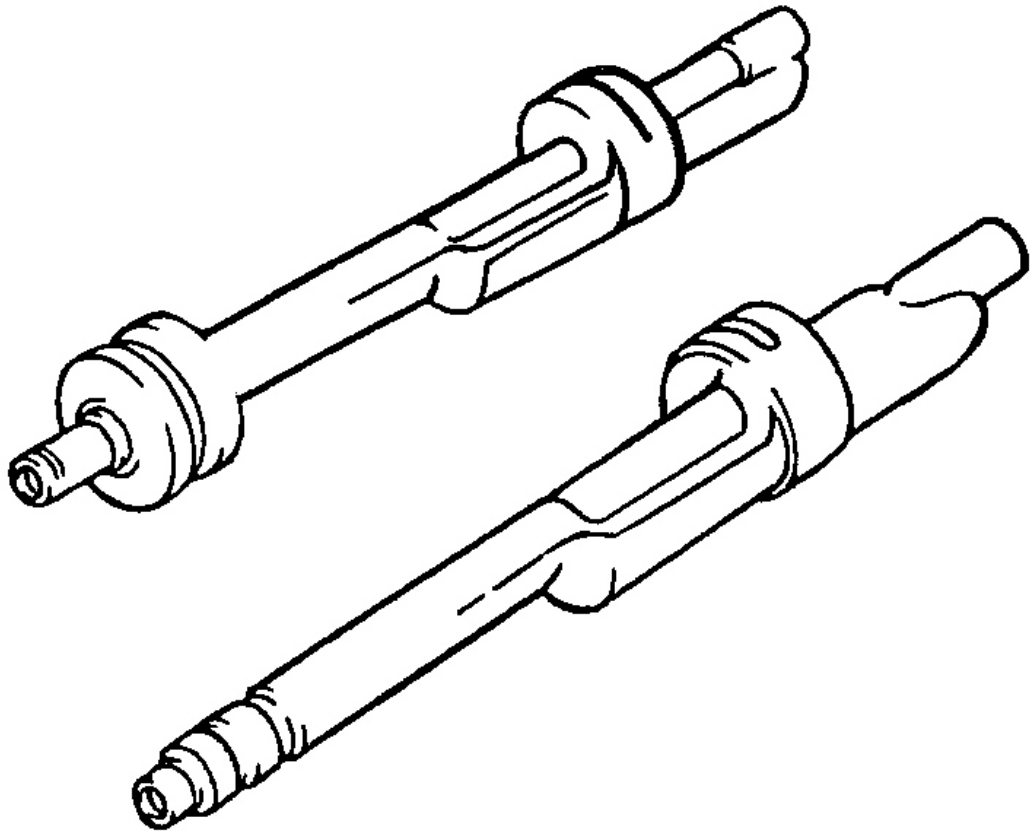
(Used in Step 9)

Inspection

1. Check all oil holes for clogging. Clean the holes if necessary.
2. Check the counter balance shaft front bearing for wear, damage and seizure. If there is anything wrong with the bearing, replace the front case.
3. Check the front case for cracks and other damage.
4. Replace a cracked or damaged front case.

Counter Balance Shaft

1. Check the journals for wear or seizure.
2. If excessive wear or seizure is evident, check the bearing carefully.
3. If necessary, replace the counter balance shaft bearing or the shaft itself.



G00790014

Fig. 70: Identifying Counter Balance Shaft

Oil Seal

1. Check the oil seal lip for wear and damage. Replace the oil seal if necessary.
2. Check the oil seal lip for deterioration. Replace the oil seal if necessary.

Oil Pressure Switch

1. Check the continuity between the terminal and the body with an ohmmeter.

   If there is no continuity, replace the oil pressure switch.

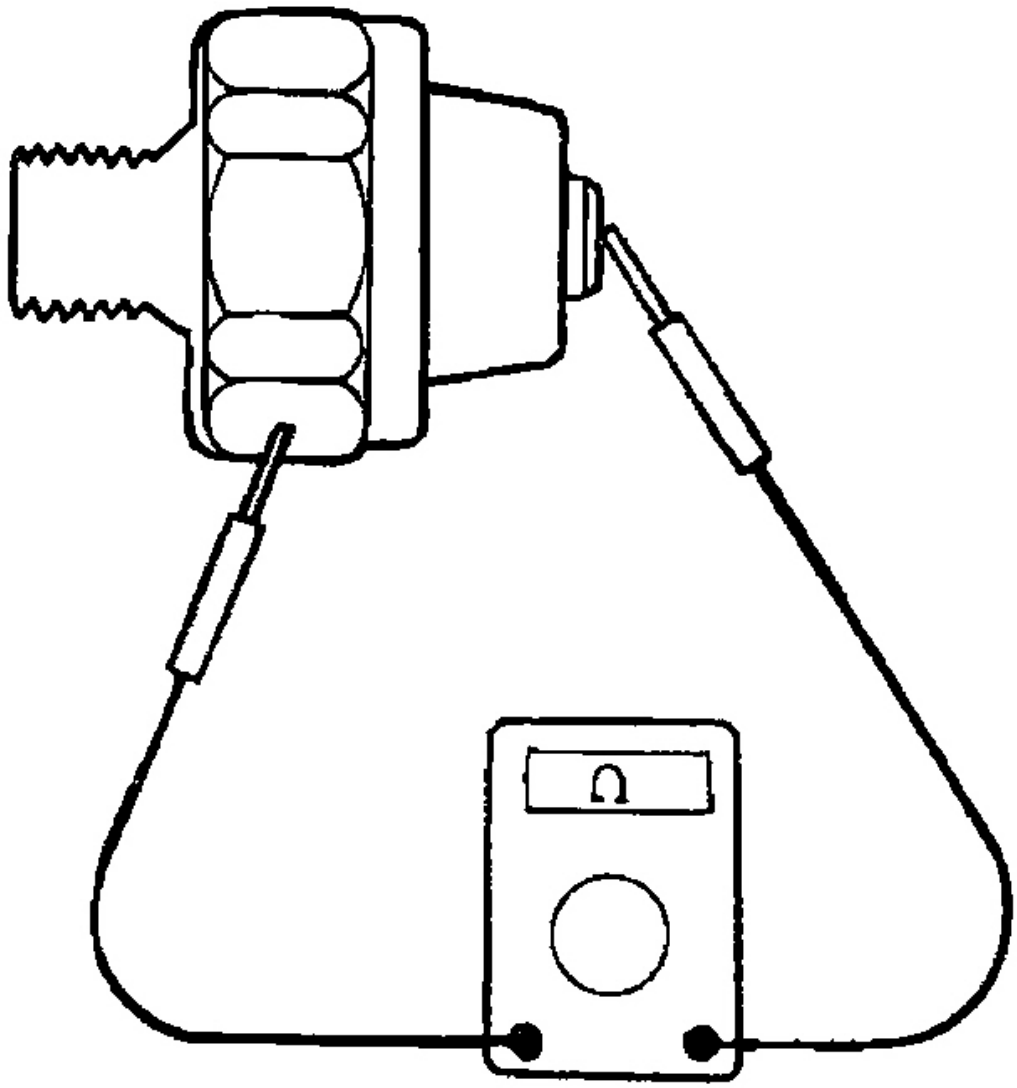

Fig. 71: Checking Oil Pressure Switch Continuity
Courtesy of HYUNDAI MOTOR CO.

2. Check the continuity between the terminal and the body when the fine wire is pushed. If there is continuity even when the fine wire is pushed, replace the switch.
3. If there is no continuity when a 50 kPa (7 psi) vacuum is applied through the oil hole, the switch is operating properly. Check for an air leak. If air leaks, the diaphragm is broken. Replace the switch.

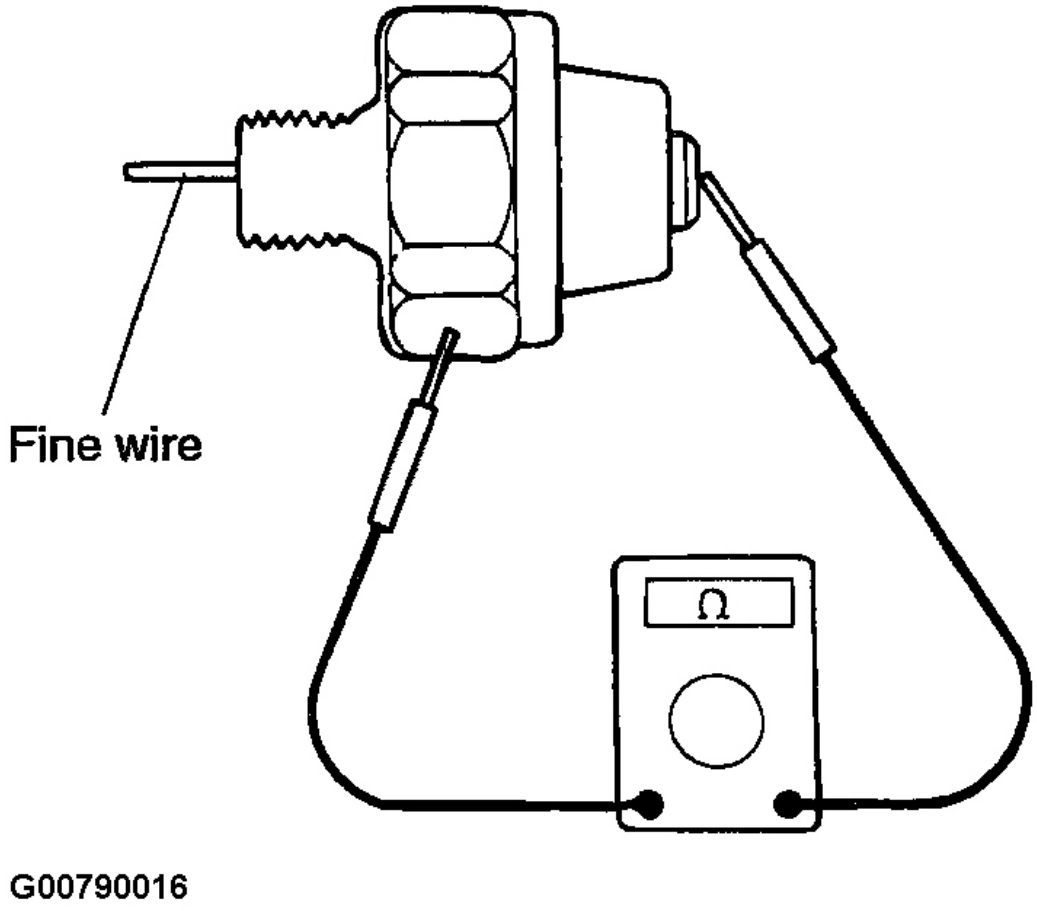

Fig. 72: Checking Oil Pressure Switch Continuity With Fine Wire

Oil Pump

1. Assemble the oil pump gear to the front case and rotate it to verify smooth rotation with no looseness.
2. Make sure that there is no ridge wear on the contact surface between the front case and the gear surface of the oil pump cover.
3. Install the drive and driven gears to the front case. Measure the tip clearance of the gears.

   [Standard value]

   Drive gear : 0.16 ~ 0.21 mm (0.0063 ~ 0.0083 in.)

   Driven gear : 0.18 ~ 0.21 mm (0.0071 ~ 0.0083 in.)

[Limit]

Drive gear : 0.25 mm (0.0098 in)

Drive gear : 0.25 mm (0.0098 in.)

4. Check the side clearance.

[Standard value]

Drive gear : 0.08 ~ 0.14 mm (0.0031 ~ 0.0055 in.)

Driven gear : 0.06 ~ 0.12 mm (0.0024 ~ 0.0047 in.)

[Limit]

Drive gear : 0.25 mm (0.0098 in)

Driven gear : 0.25 mm (0.0098 in.)

Counter Balance Shaft Bearing

Replacement

1. Using a special tool, remove the front bearing of the right counter balance shaft from the cylinder block.

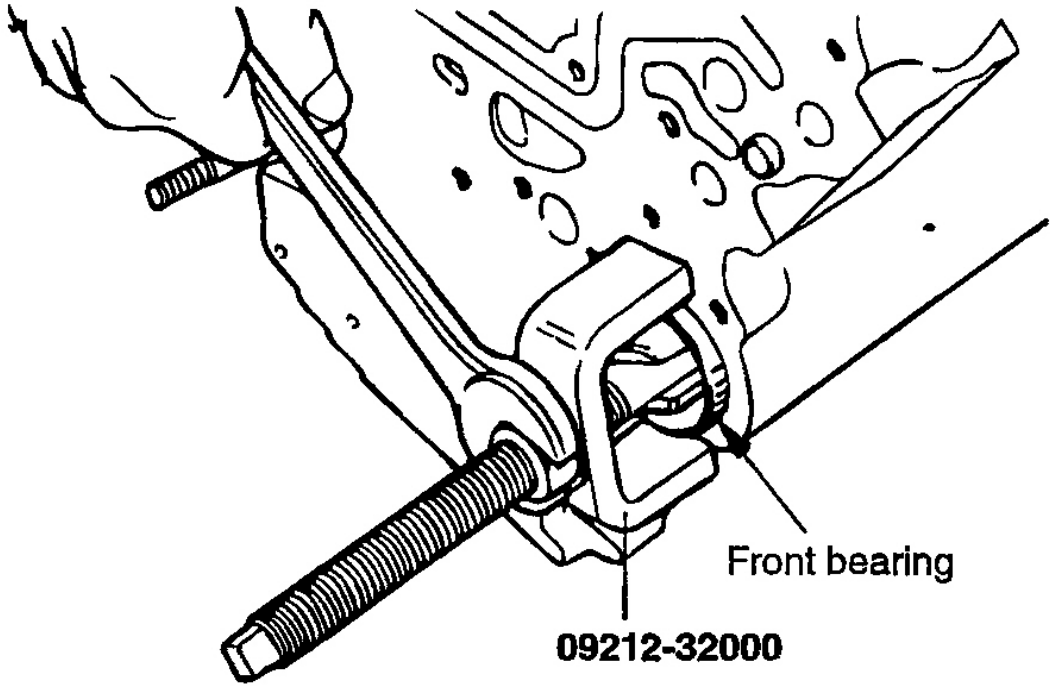

Fig. 75: Removing Right Front Bearing
Courtesy of HYUNDAI MOTOR CO.

2. Using a special tool, remove the rear bearing of the right counter balance shaft from the cylinder block.

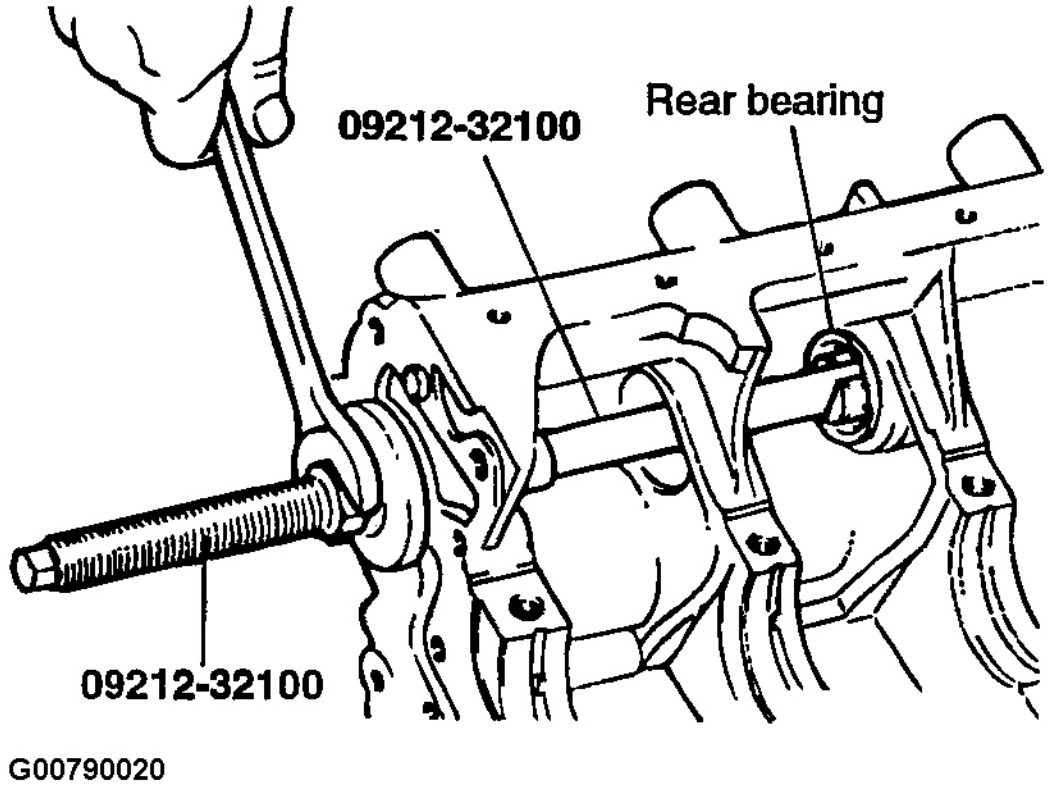

Fig. 76: Removing Right Rear Bearing
Courtesy of HYUNDAI MOTOR CO.

3. Using a special tool, remove the rear bearing of the left counter balance shaft from the cylinder block. At this time, install a special tool on the front surface of cylinder block to hold the bearing puller.

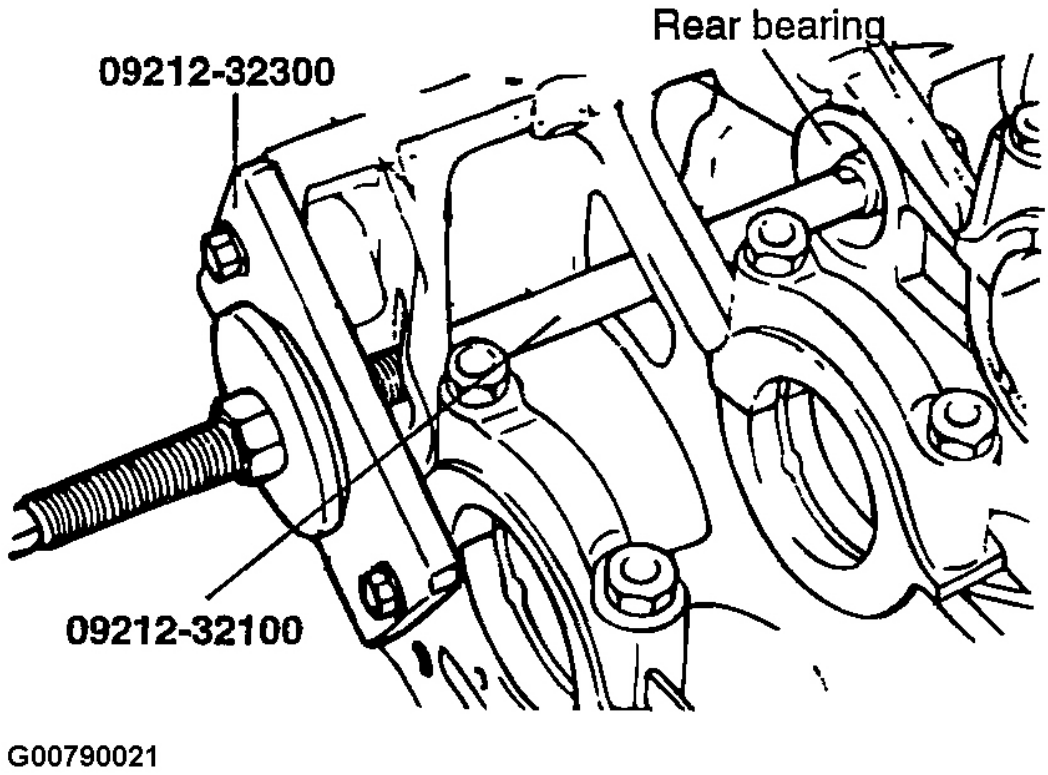

Fig. 77: Removing Left Rear Bearing

4. Using a special tool, install the rear bearing of the left counter balance shaft to the cylinder block.

NOTE:

1. **Apply engine oil to the outside of rear bearing and bearing hole in cylinder block.**
2. **The left rear bearing has no oil holes.**

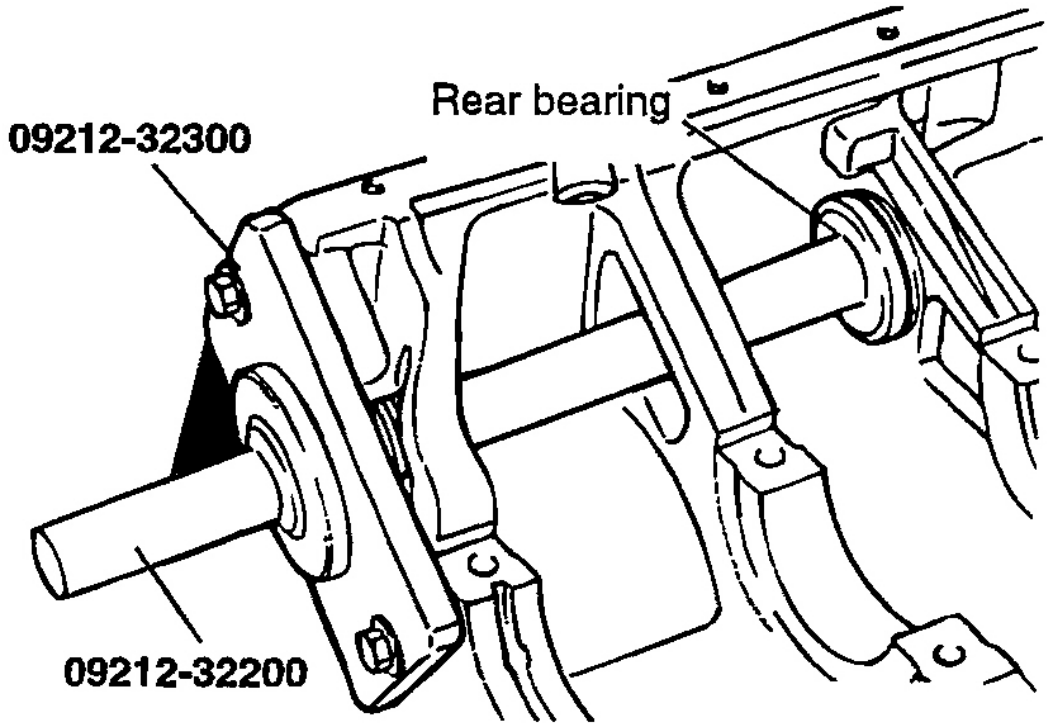

Fig. 78: Installing Left Rear Bearing
Courtesy of HYUNDAI MOTOR CO.

5. Using a special tool, install the rear bearing of the right counter balance shaft to the cylinder block.

NOTE:

1. **Apply engine oil to the outside surface of the bearing.**
2. **Make sure that the bearing oil hole is aligned with the oil hole of cylinder block.**

Plug cap

Tightening torque : 20 ~ 27 Nm (200 ~ 270 kg.cm, 14 ~ 20 lb.ft)

9. Apply sealant to the groove of the pan flange as shown.

NOTE:

1. **Apply sealant approximately 4 mm (0.16 in.) in thickness.**
2. **After the application of the sealant, install the oil pan within 15 minutes.**

10. Note the difference in bolt lengths at the locations shown.

    Install the upper and lower oil pans and tighten the bolts to the specified torque.

    Tightening torque

    Oil pan bolt : 10 ~ 12 Nm (100 ~ 120 kg.cm, 7 ~ 9 lb.ft)

11. Using a 24 mm deep socket, install the oil pressure switch after applying sealant to the threaded area.

Sealant : Threebond 1104 or equivalent

NOTE: Do not torque the oil pressure switch excessively.

Disassembly

1. Disconnect the negative terminal from the battery.
2. Drain the engine coolant.
3. Remove the breather hose between the air cleaner and the rocker cover.
4. Remove the air cleaner.

5. Remove the timing belt cover.
6. Remove the rocker cover and camshaft position sensor.
7. Loosen the camshaft sprocket bolts then remove the camshaft sprockets.
8. Loosen the camshaft bearing cap bolts and remove the bearing caps, camshafts, rocker arms and lash adjusters.

CAUTION: Loosen the cap bolts in increments to avoid bending the camshafts.

Inspection

Rocker Arms

1. Check rotation of the roller. If they do not rotate smoothly or are loose, replace them.
2. Check the roller surface. Replace if there is any dent, damage or evidence of seizure.

3. Check the valve contact surface for possible damage or evidence of seizure. Replace if necessary.

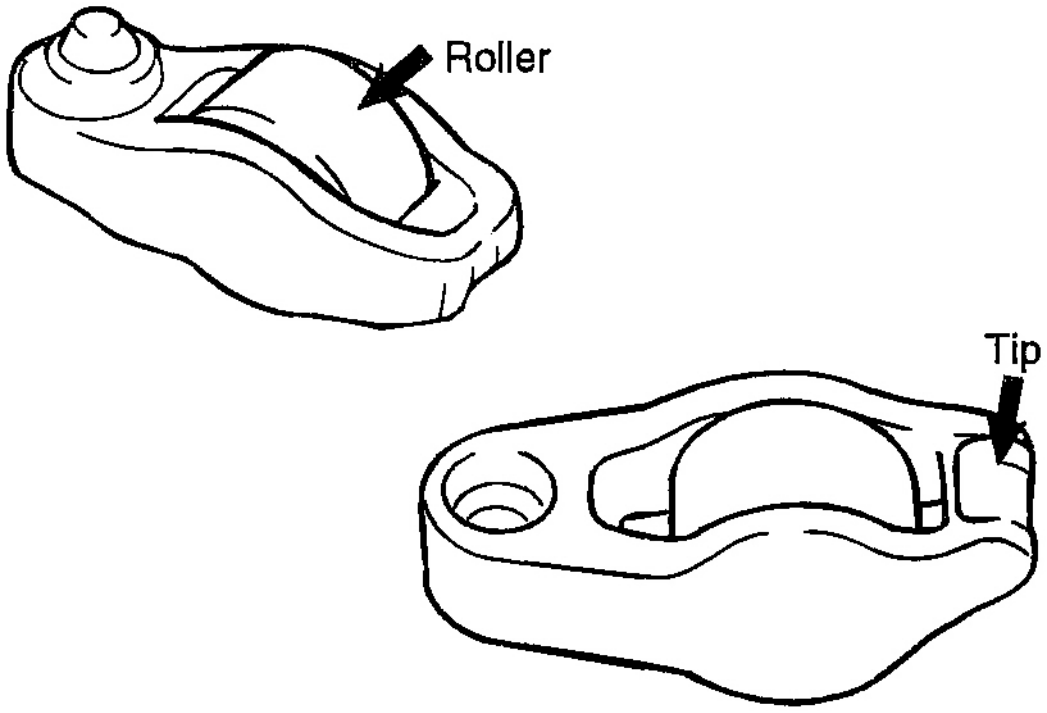

Fig. 93: Identifying Rocker Arms

CAMSHAFTS

1. Check the camshaft journals for wear. If the journals are badly worn, replace the camshaft.
2. Check the cam lobes for damage. If the lobe is damaged or worn excessively, replace the camshaft.

Cam height

[Standard]

Intake : 35.493 mm (1.3974 in.)

Exhaust : 35.317 mm (1.3904)

Reassembly

1. Install the camshafts on the cylinder head. Do not install the rocker arms yet.

NOTE:

1. **Apply engine oil to journals and cams of the camshafts.**
2. **The exhaust camshaft has a slit on its rear end for the crankshaft position sensor.**

Disassembly

Connecting Rod Cap

NOTE: Keep the bearings in order with their corresponding connecting rods (according to cylinder numbers) for proper reassembly.

1. Remove the connecting rod cap nuts and then remove the caps and the big end lower bearing. Mark for reassembly.
2. Push each piston-connecting rod assembly toward the top of the cylinder.

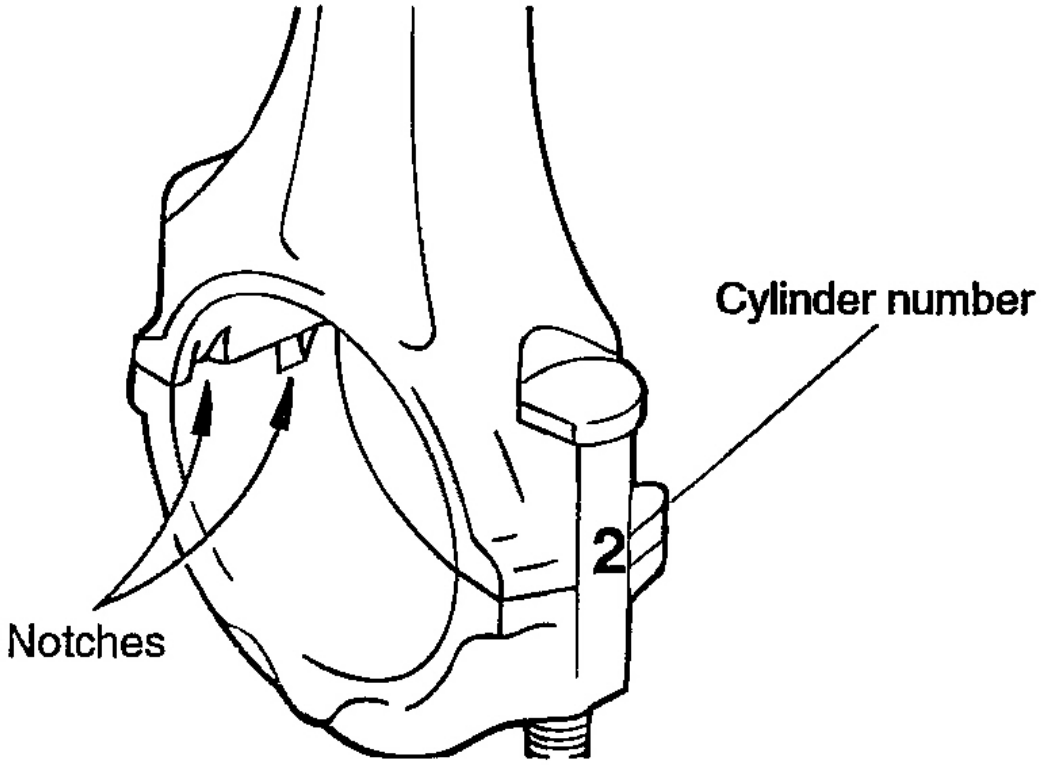

Fig. 109: Identifying Connecting Rod Bearing Notches
Courtesy of HYUNDAI MOTOR CO.

Disassembly & Reassembly Of Piston Pin

1. Use the special tools 09234 - 33001 and 09234 - 33002, disassemble and reassemble the piston and connecting rod.

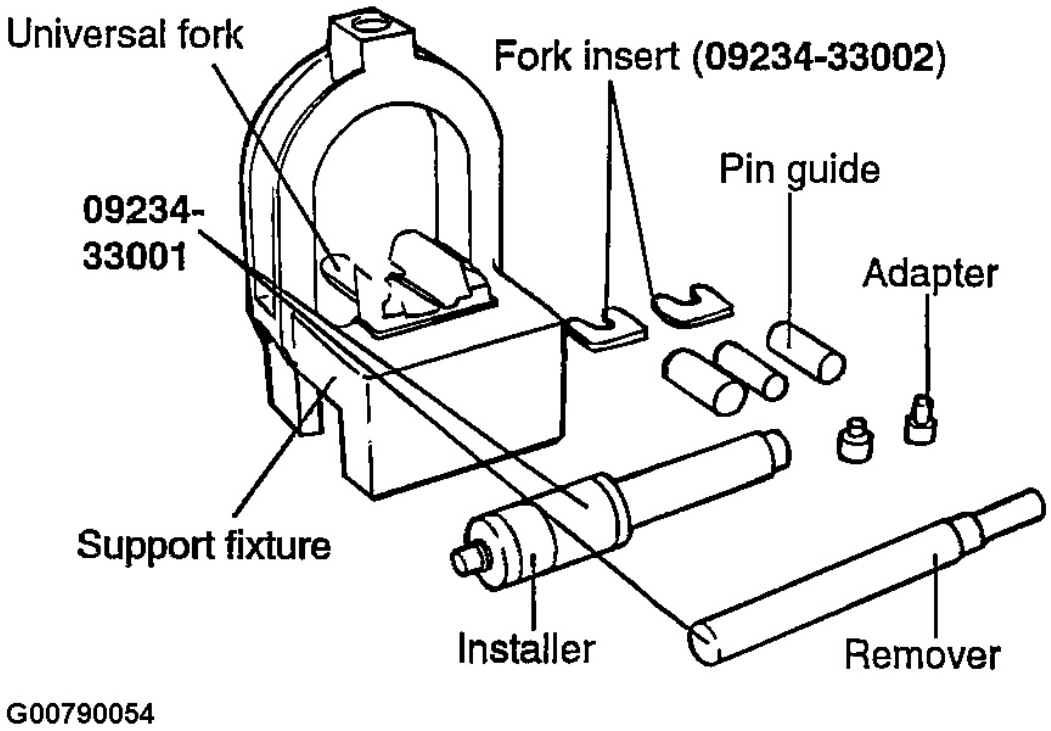

Fig. 110: Identifying Special Tools
Courtesy of HYUNDAI MOTOR CO.

2. The piston pin is a press fit in the rod little end, and the piston floats on the pin.
3. The tool consists of a support fixture with fork inserts, guides, adapters, an installer and a remover. The piston is supported in the support fixture while the pin is being installed or removed. Guides help position the pin as it is installed or removed, while the rod is supported by fork inserts.
4. To remove the pin from the piston, place the piston in the support fixture while the rod resting on the fork inserts. Pass the remover tool through the top of the support fixture and use it to press out the pin.

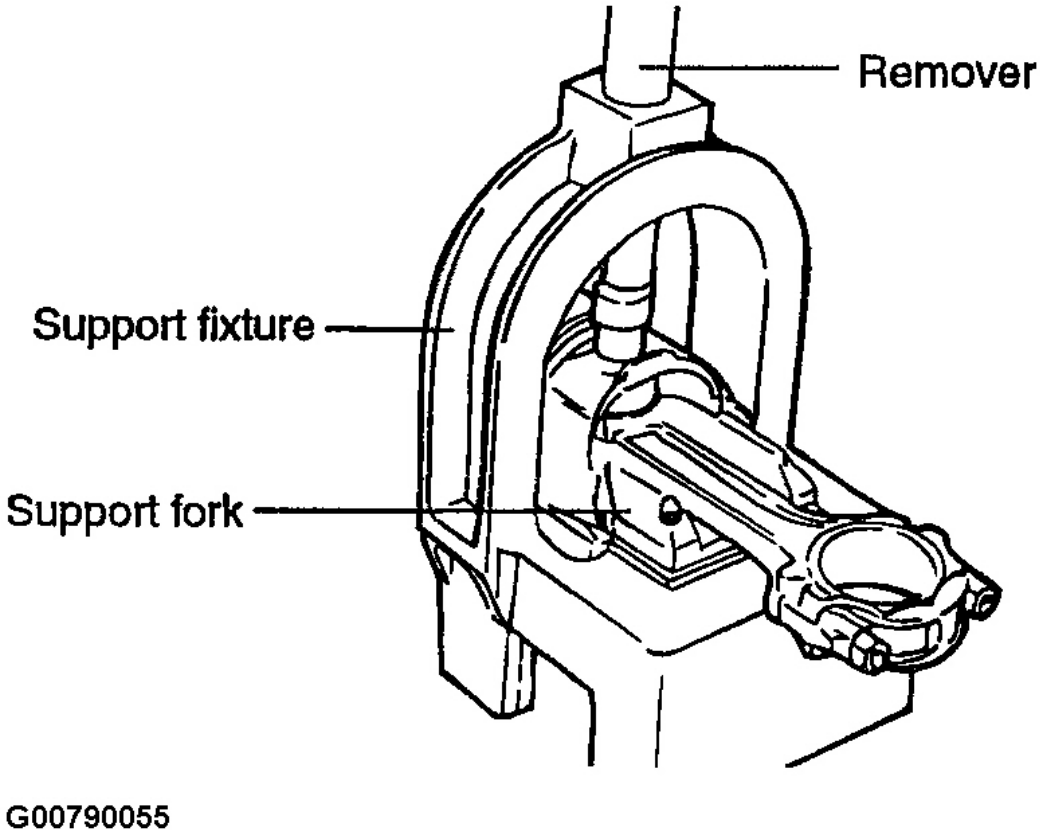

Fig. 111: Removing Piston Pin
Courtesy of HYUNDAI MOTOR CO.

5. To install a new pin, the proper fork inserts must be in place to support the rod.
6. Position the rod inside the piston. Insert the proper pin guide through on side of the piston and through the rod. Hand tap the pin guide so it is held by the piston. Insert the new pin into the piston from the other side and set the assembly into the support fixture with the pin guide facing down.

NOTE: The pin guide should be centered on the connecting rod though the piston. If assembled correctly, the pin guide will sit exactly under the center of the hole in the tool's arch, and rest evenly on the fort inserts. If the wrong size pin guide is used, the piston and pin will not line up with the support fixture.

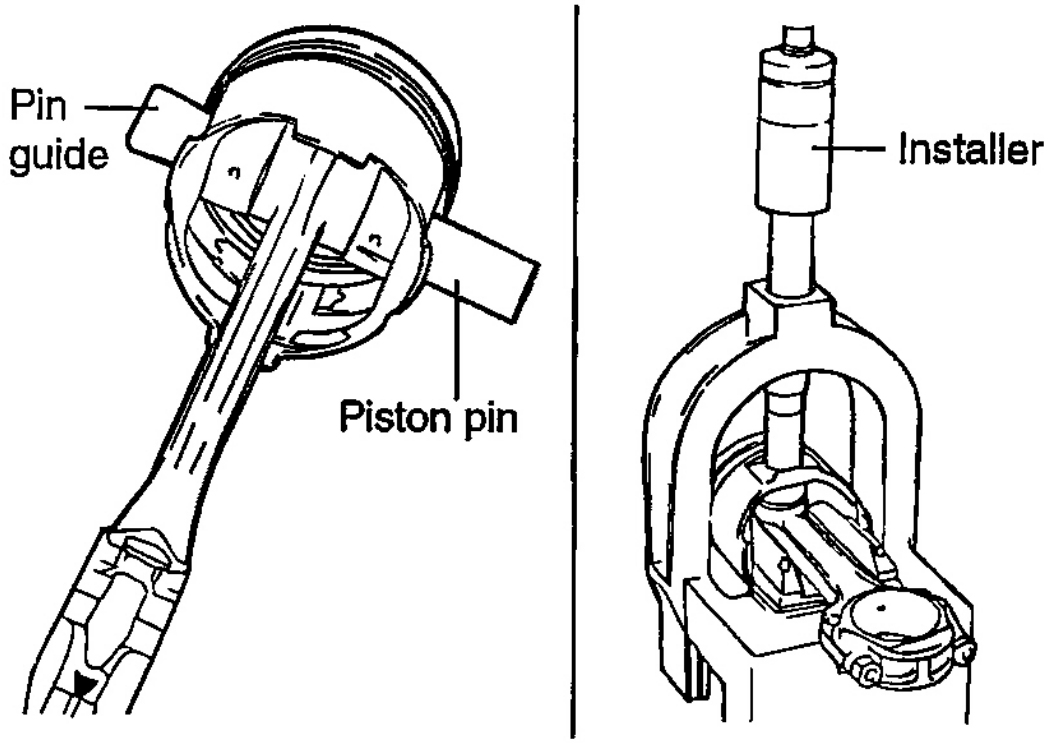

Fig. 112: Installing Piston Pin
Courtesy of HYUNDAI MOTOR CO.

7. Insert the installer tool through the hole in the arch of the support fixture and use an hydraulic press to force the piston pin through the rod little end. Continue pressing until the pin guide falls free and the installer tool seats against the top of the arch.

CAUTION: Do not exceed 1250 +/- 500 kg (2756 +/- 1102 lb) of force when stopping the installing arbor sleeve against the arch.

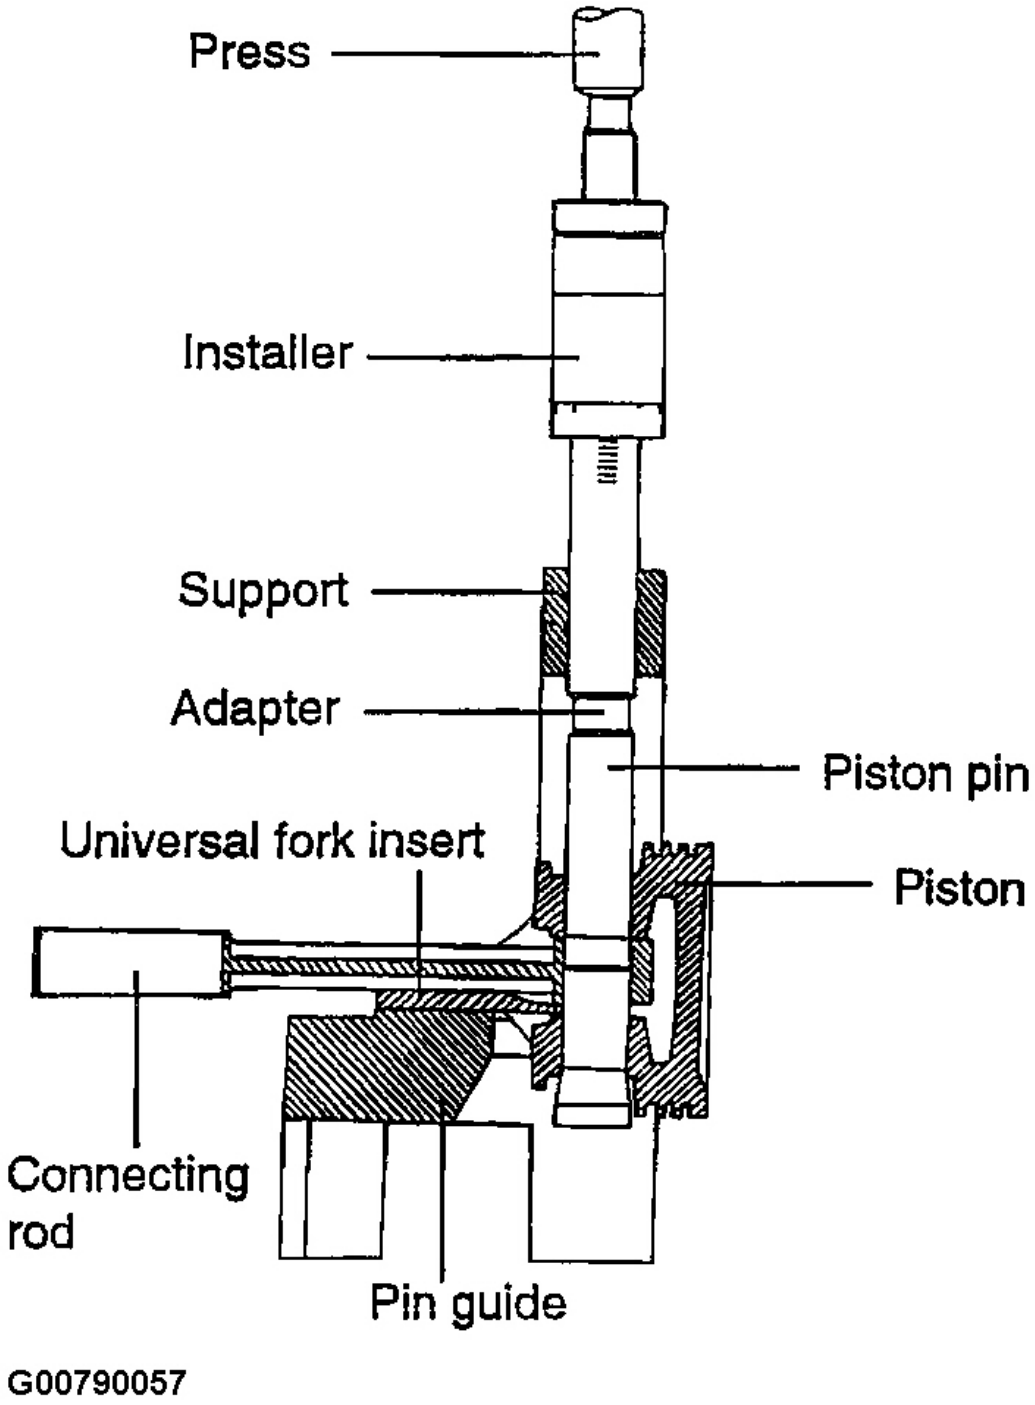

Fig. 113: Installing Piston Pin
Courtesy of HYUNDAI MOTOR CO.

Inspection

Piston & Piston Pins

1. Check each piston for scuffing, scoring, wear and other defects. Replace any piston that is defective.
2. Check each piston ring for breakage, damage and abnormal wear. Replace the defective rings. When the piston requires replacement, its rings should also be replaced.
3. Check that the piston pin fits in the piston pin hole. Replace any piston and pin assembly that is defective. The piston pin must be smoothly pressed by hand into the pin hole (at room temperature).

Piston Rings

1. Measure the piston ring side clearance. If the measured value exceeds the service limit, insert a new ring in a ring groove to measure the side clearance. If the clearance still exceeds the service limit, replace the piston and rings together. If it is less than the service limit, replace only the piston ring only.

   Standard value

   Piston ring side clearance :

   No. 1 : 0.03 ~ 0.07 mm (0.0012 ~ 0.0028 in.)

   No. 2 : 0.02 ~ 0.06 mm (0.0008 ~ 0.0024 in.)

   Oil ring : 0.06 ~ 0.15 mm (0.0024 ~ 0.0059 in.)

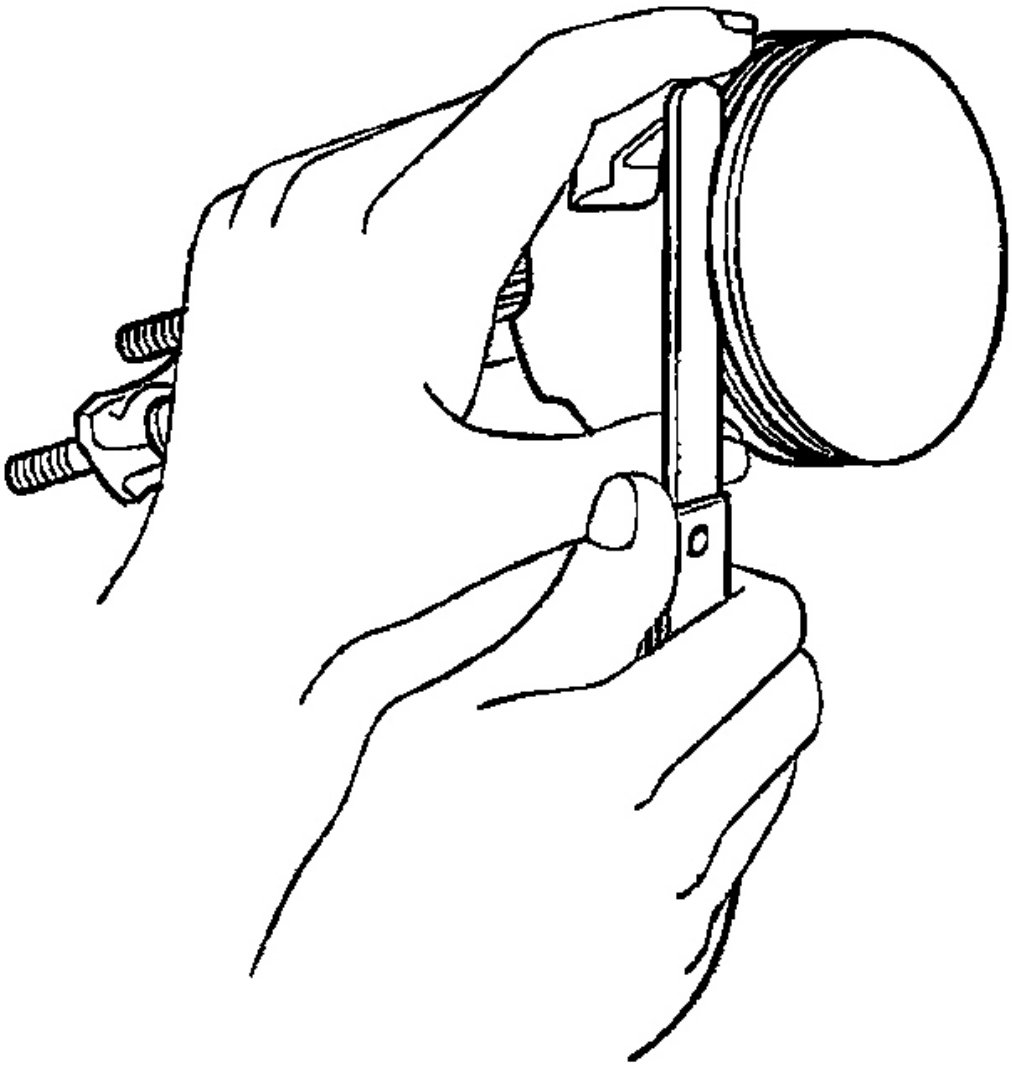

Fig. 114: Measuring Piston Ring Side Clearance
Courtesy of HYUNDAI MOTOR CO.

2. To measure the piston ring end gap, insert a piston ring into the cylinder bore. Position the ring at right angles to the cylinder wall by gently pressing it down with a piston. Measure the gap with a feeler gauge. If the gap exceeds the service limit, replace the piston ring.

Piston ring end gap

[Standard dimensions]

No.1 : 0.25 - 0.35 mm (0.0098 - 0.0138 in.)

No.2 : 0.40 - 0.55 mm (0.0157 - 0.0216 in.)

[Limit]

No.1, No.2 : 0.8 mm (0.031 in.)

Oil ring side rail : 1.0 mm (0.039 in.)

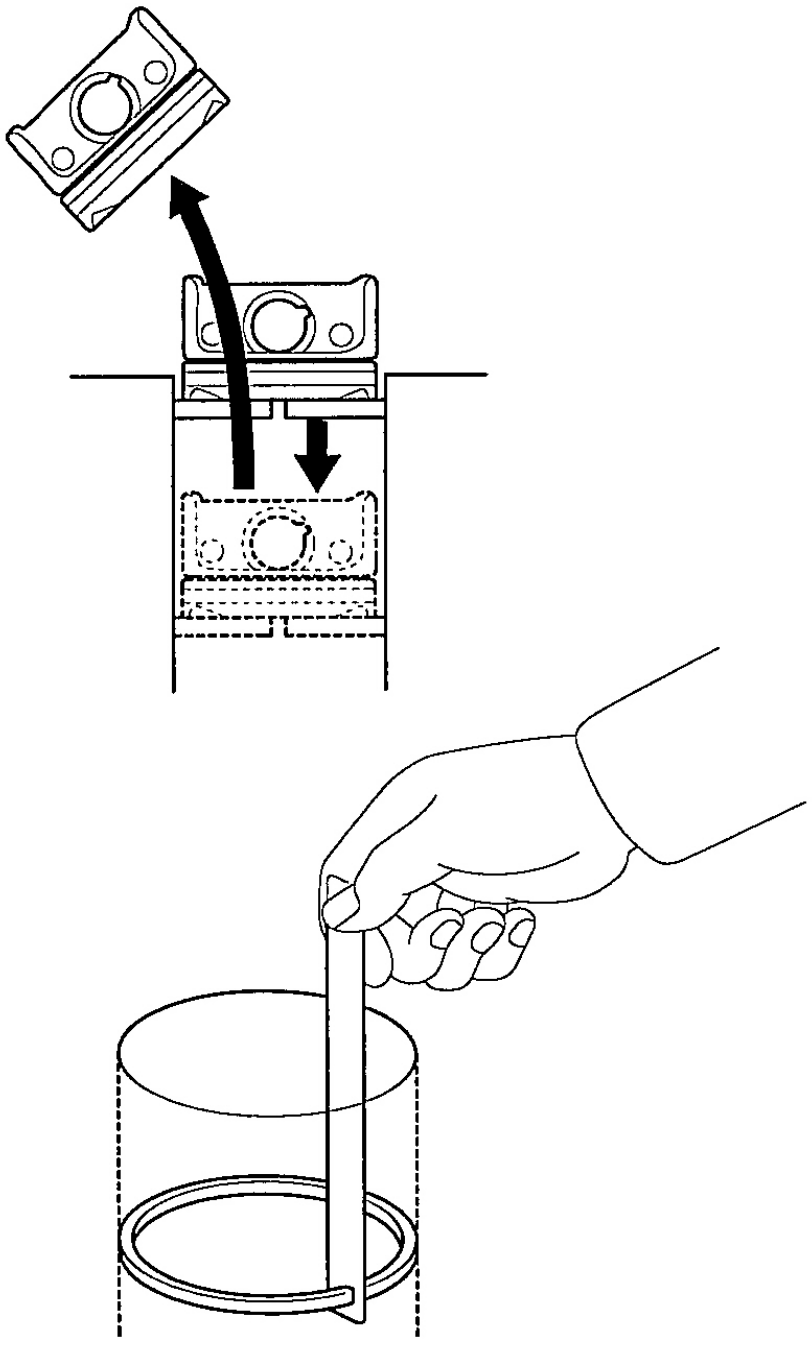

Fig. 115: Measuring Piston Ring End Gap

Connecting Rods

1. When the connecting rod cap is installed, make sure that cylinder numbers, marked on the rod end cap at disassembly, match. When a new connecting rod is installed, make sure that the notches for holding the bearing in place are on the same side.
2. Replace the connecting rod if it is damaged at either end of the thrust faces. If it has stratified wear in, or if the surface of, the inside diameter of the small end is severely rough, replace the rod.

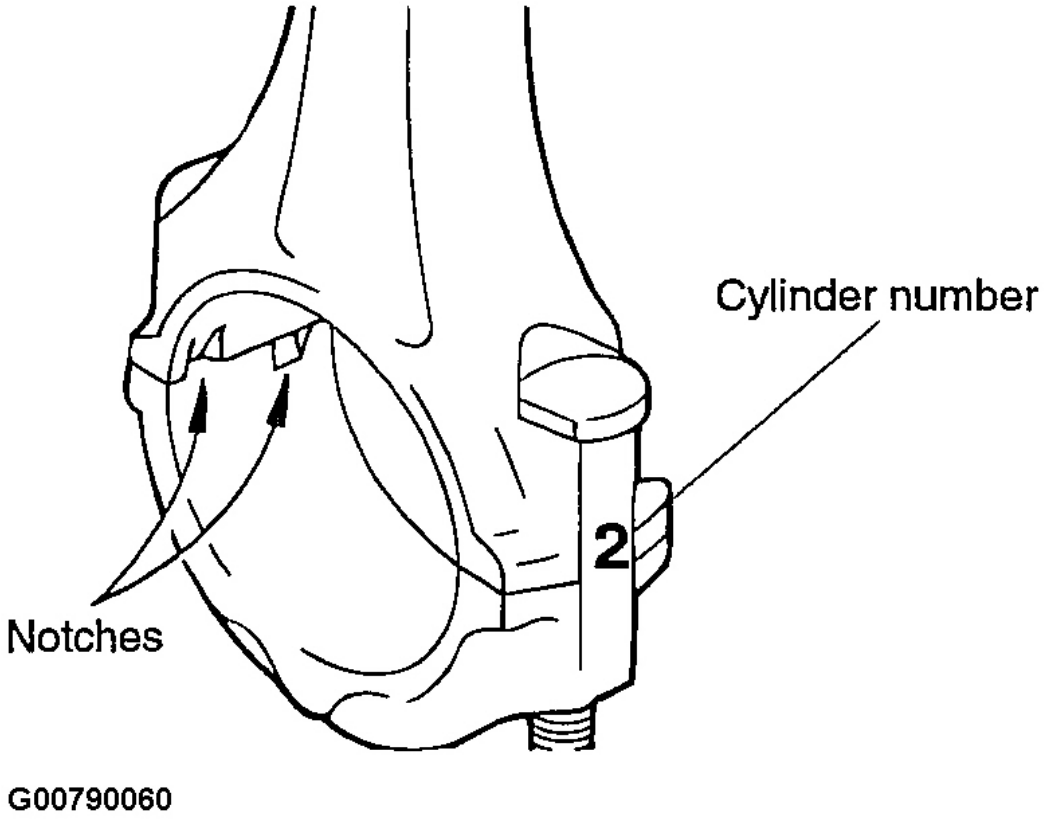

Fig. 116: Identifying Connecting Rod Bearing Notches

Reassembly

1. Install the spacer.

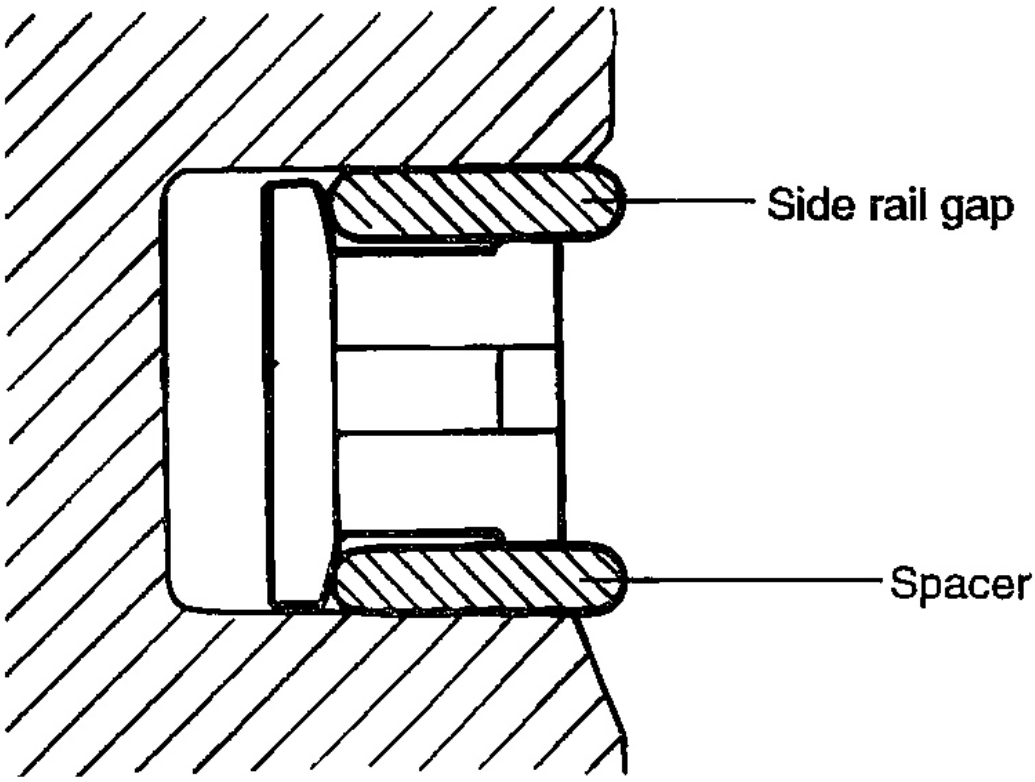

Fig. 117: Identifying Spacer Installation (1 Of 2)
Courtesy of HYUNDAI MOTOR CO.

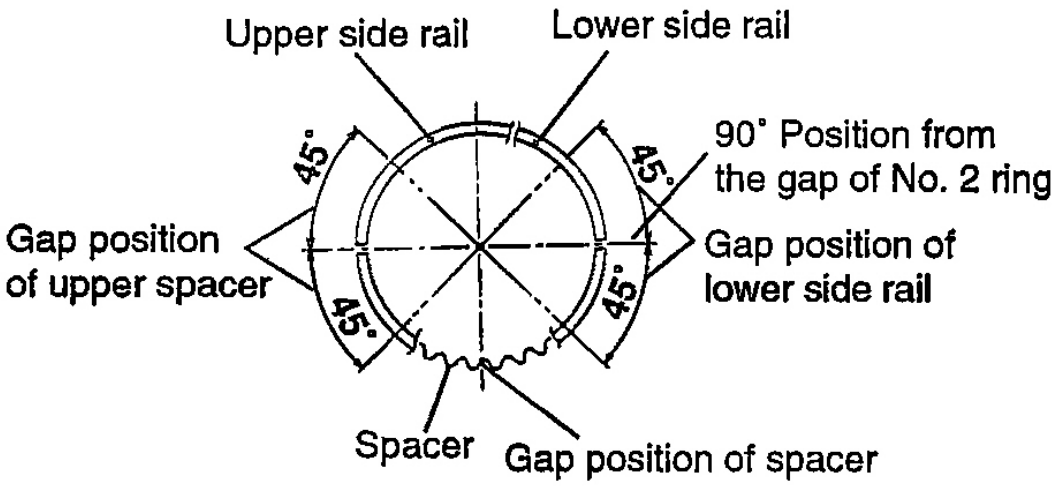

Fig. 118: Identifying Spacer Installation (2 Of 2)
Courtesy of HYUNDAI MOTOR CO.

2. Install the upper side rail. To install the side rail, first put one end of the side rail between the piston ring groove and spacer, hold it firmly, then press down with your finger the portion to be inserted into groove as illustrated.

WARNING: Do not use a piston ring expander when installing the side rail.

3. Install the lower side rail by the same procedure as described in Step No. 2.

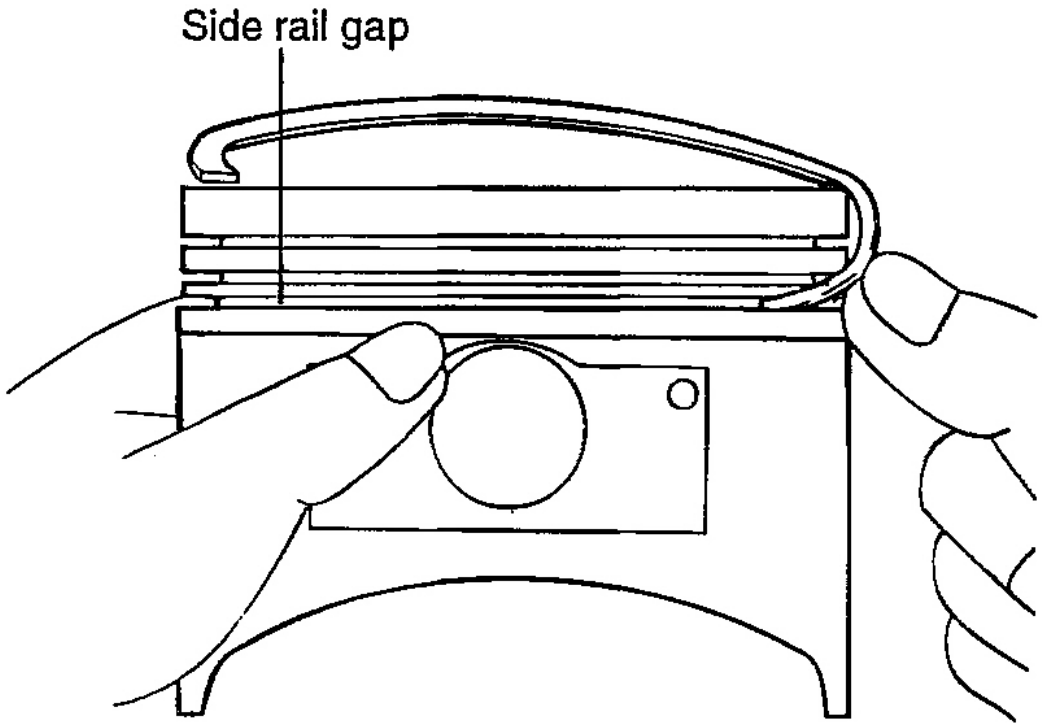

Fig. 119: Installing Side Rail
Courtesy of HYUNDAI MOTOR CO.

4. Apply engine oil around the piston and piston grooves.
5. Using piston ring expander, install the No. 2 piston ring.
6. Install the No. 1 piston ring.

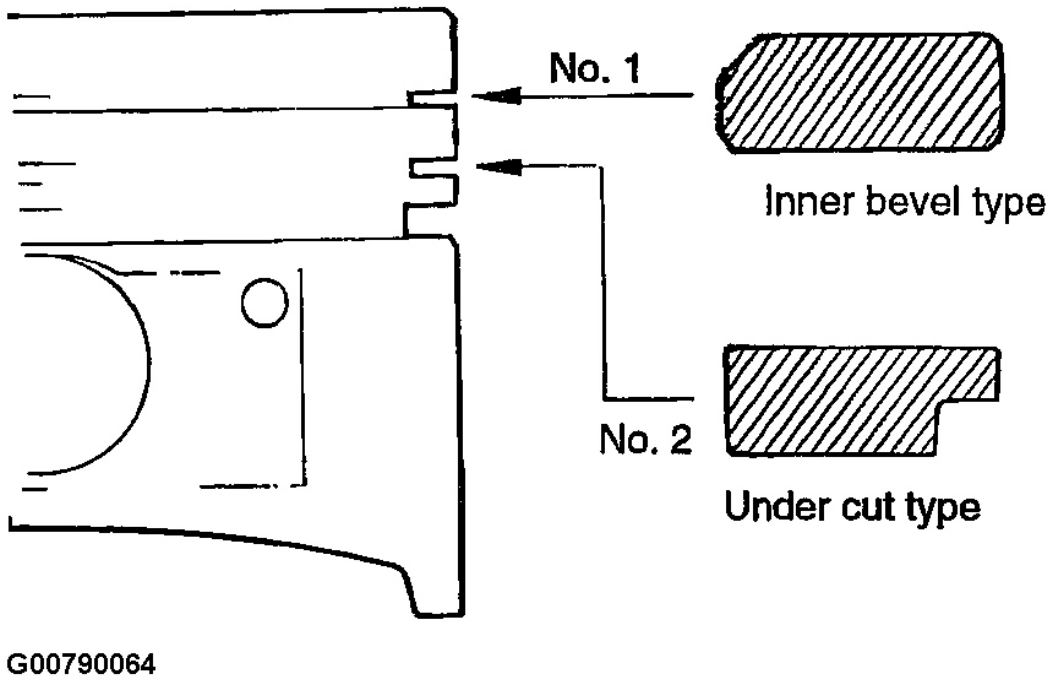

Fig. 120: Identifying Piston Rings
Courtesy of HYUNDAI MOTOR CO.

7. Place each piston ring end gap as far apart from its neighboring gaps as possible. Make sure that gaps are not positioned in the thrust and pin directions.
8. Hold the piston rings firmly with a piston ring compressor as they are inserted into cylinder.

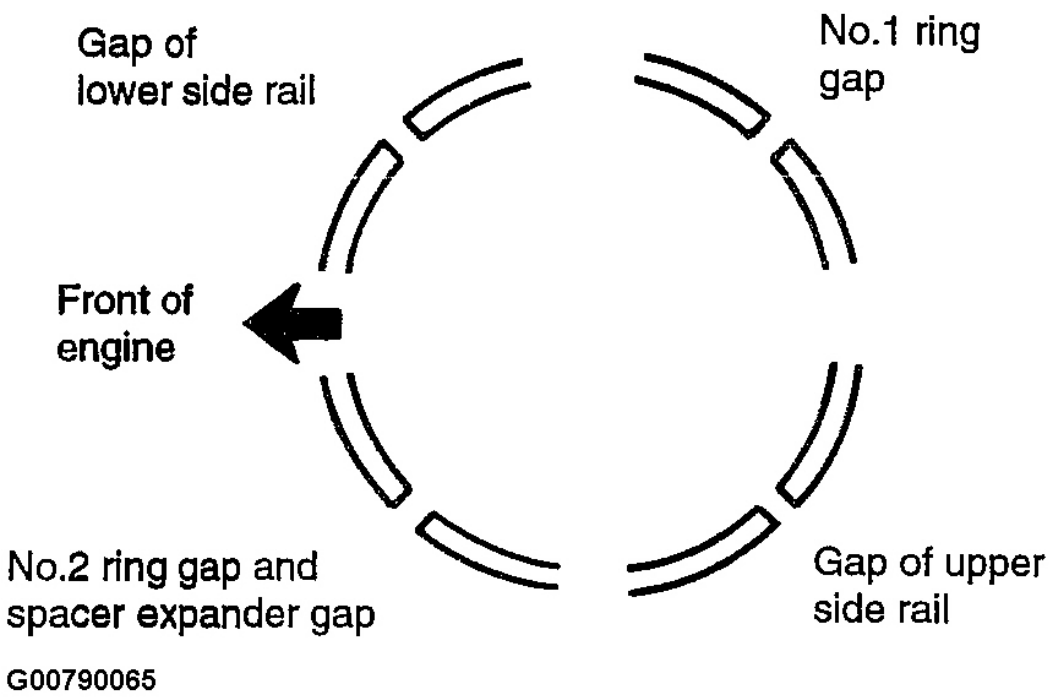

Fig. 121: Identifying Piston Installation
Courtesy of HYUNDAI MOTOR CO.

9. Make sure that the front mark of the piston and the front mark (identification mark) of the connecting rod are directed toward the front of the engine.
10. When the connecting rod cap is installed, make sure that the cylinder numbers put on the rod and cap at disassembly match.
11. When a new connecting rod is installed, make sure that the notches for holding the bearing in place are on the same side.
12. Tighten the connecting rod cap nuts.

Tightening torque

Connecting rod cap nuts :

20 Nm (200 kg.cm, 15 lb.ft) + 90°

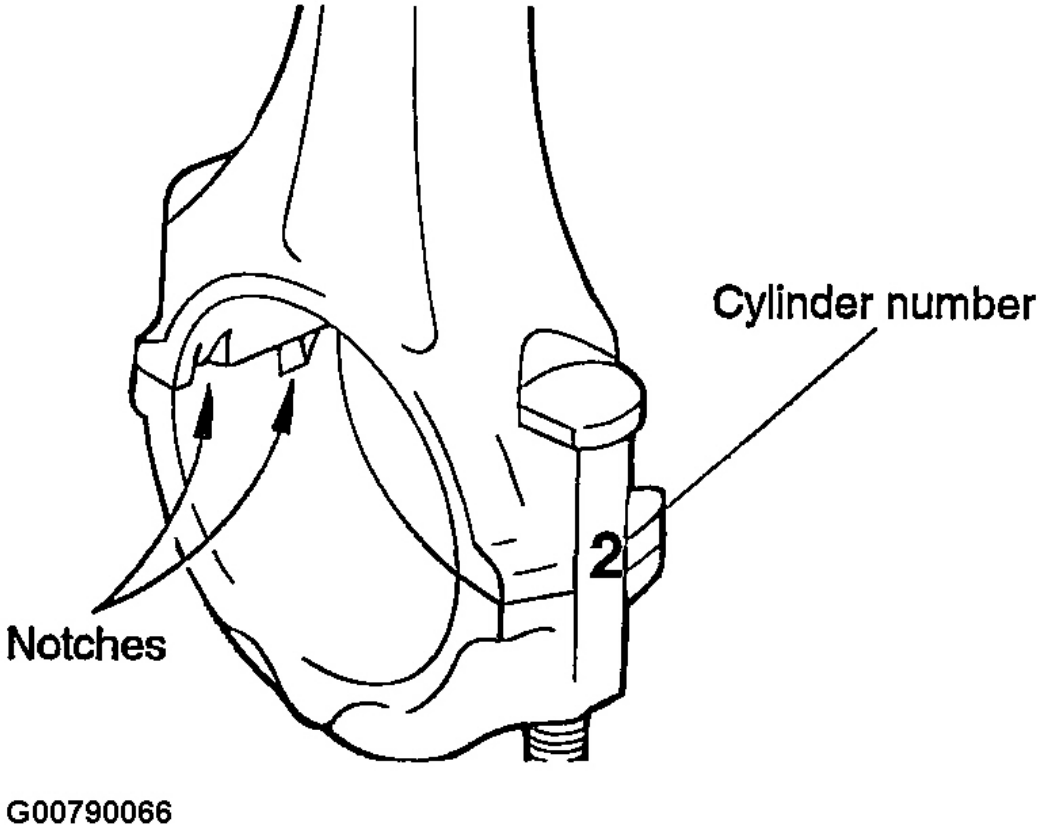

Fig. 122: Identifying Connecting Rod Bearing Notches

Disassembly

1. Remove the following components :
   - Timing belt. See **TIMING BELT**.
   - Front case. See **FRONT CASE**.

- Flywheel.
- Cylinder head assembly. See **CYLINDER HEAD**.
- Oil pan.

2. Remove the rear plate and the rear oil seal.
3. Remove the connecting rod caps.

NOTE: Mark the main bearing caps to be able to reassemble in the original position and direction.

4. Remove the main bearing caps and the crankshaft. Keep the bearings in order according to the cap number.

Inspection

1. Check the crankshaft journals and pins for damage, uneven wear and cracks. Also check the oil holes for restrictions. Repair or replace any defective part.
2. Inspect the crankshaft journal for taper and out-of-round.

Standard value

Crankshaft journal O.D :

56.982 ~ 57.000 mm (2.2434 ~ 2.2441 in.)

Crankshaft pin O.D :

44.980 - 45.000 mm (1.7709 - 1.7717 in.)

Main Bearings & Connecting Rod Bearings

Visually inspect each bearing for peeling, melting, seizure and improper contact. Replace any defective bearings.

Measuring Oil Clearance

Check the oil clearance by measuring the outside diameter of the crankshaft journal as well as the inside diameter of the bearing. The clearance can be obtained by calculating the difference between the measured diameters.

Standard value

Oil clearance

Crankshaft main bearing

No. 1,2,4,5 : 0.018 ~ 0.036 mm (0.0007 ~ 0.0014 in.)

No.3 : 0.024 ~ 0.042 mm (0.0009 ~ 0.0017 in.)

4. Apply engine oil to journals and pins. Install the crankshaft.
5. Install the bearing caps with the arrow mark directed toward the front of the engine. The cap number must be correct.
6. Tighten the cap bolts to the specified torque.

Tightening torque

Main bearing cap bolts : 25 Nm (250 kg.cm, 18lb.ft) + (90°)

7. Cap bolts should be tightened evenly in 4 to 5 increments before they are tightened to the specified torque.
8. Make sure that the crankshaft turns freely and check the end play of the crankshaft.
9. Using a special tool (09231 - 21000). Install the oil seal in the oil seal case. A new oil seal should be used.

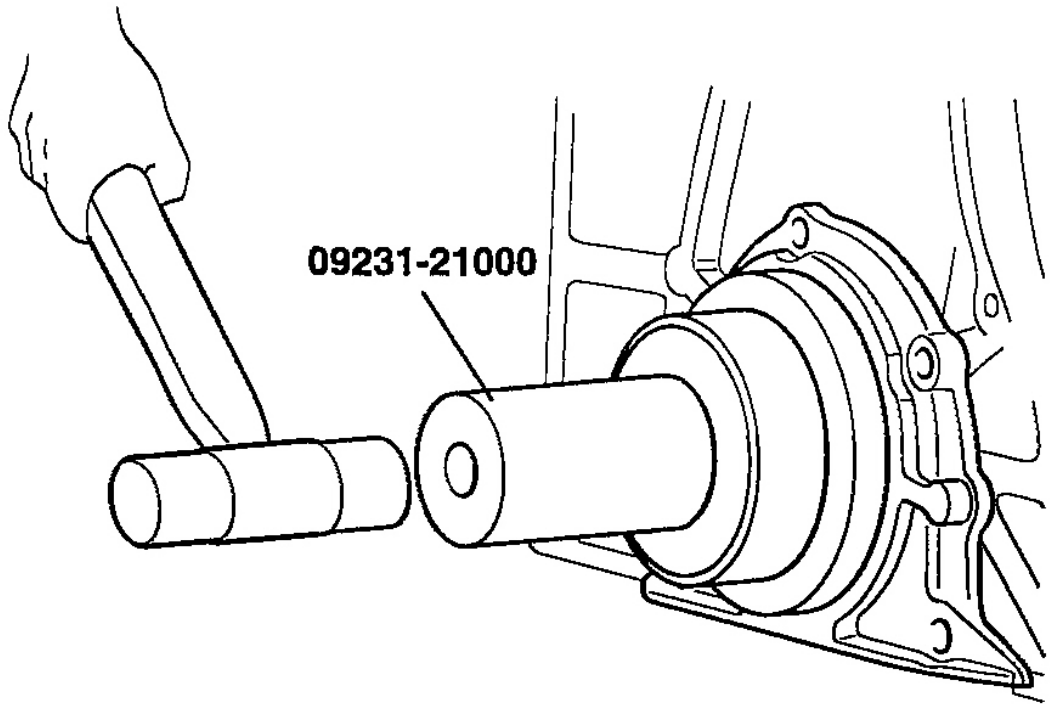

Fig. 128: Installing Oil Seal In Case

11. Install the new oil seal case gasket and oil seal case assembly.

Tightening torque

Oil seal case : 10 ~ 12 Nm (100 ~ 120 kg.cm, 7 ~ 9 lb.ft)

(For M/T)

12. Install the rear plate to the cylinder block.
13. Install the flywheel assembly and tighten the bolts to the specified torque.

Tightening torque

Flywheel bolt :

130 ~ 140 Nm (1300 ~ 1400 kg.cm, 94 ~ 101 lb.ft)

(For A/T)

14. Install the adapter plate to the cylinder block.
15. Install the drive plate and tighten the bolts to the specified torque.

Tightening torque

Driver plate : 130 ~ 140 Nm (1300 ~ 1400 kg.cm, 94 ~ 101 lb.ft)

Removal

1. Remove the heat protector.
2. Remove the exhaust manifold.
3. Remove the exhaust manifold gasket.

Inspection

1. Check for damage or cracking.
2. Using a straight edge and feeler gauge, check for distortion on the cylinder head matching surface.

   Standard value : 0.15 mm (0.006 in.)

   Service limit : 0.3 mm (0.012 in.)

3. Check the exhaust manifold for damage and cracking.

Installation

1. Install the exhaust manifold with its gasket.

Tightening torque

Exhaust manifold

M8 : 25 ~ 30 Nm (250 ~ 300 kg.cm, 18 ~ 22 lb.ft)

M10 : 35 ~ 35 Nm (350 ~ 550 kg.cm, 25 ~ 40 lb.ft)

NOTE: Do not use the used exhaust manifold gasket.

11. Remove the intake manifold.

Inspection

Intake Manifold & Surge Tank

1. Check the parts for damage or cracking.
2. Check for restrictions in the vacuum outlet port, water or gas passages.
3. Check for flatness using a straight edge and feeler gauge.

Standard value : 0.15 mm (0.06 in.) or less

Service limit : 0.2 mm (0.0078 in.)

Installation

1. Install the intake manifold and new gasket to the specified torque.

   Tightening torque

   Intake manifold

   Bolt : 15 ~ 20 Nm (150 ~ 120 kg.cm, 11 ~ 14 lb.ft)

   Nut : 30 ~ 42 Nm (300 ~ 420 kg.cm, 22 ~ 30 lb.ft)

2. Install the delivery pipe and injector assembly to the intake manifold.

   NOTE: Make certain that there is no interferences between the injectors and injector ports on the intake manifold.

Inspection

1. Check the mufflers and pipes for leaks, corrosion and damage.
2. Check the rubber hangers for deterioration and cracks.

Installation

1. Temporarily install the front exhaust pipe (catalytic converter assembly), the center exhaust pipe and the main muffler in this order.
2. Install the rubber hangers so that they hang equally (left and right).
3. Tighten the parts securely and then confirm that there is no interference with any of components.

AIR CLEANER (ACL)

Components

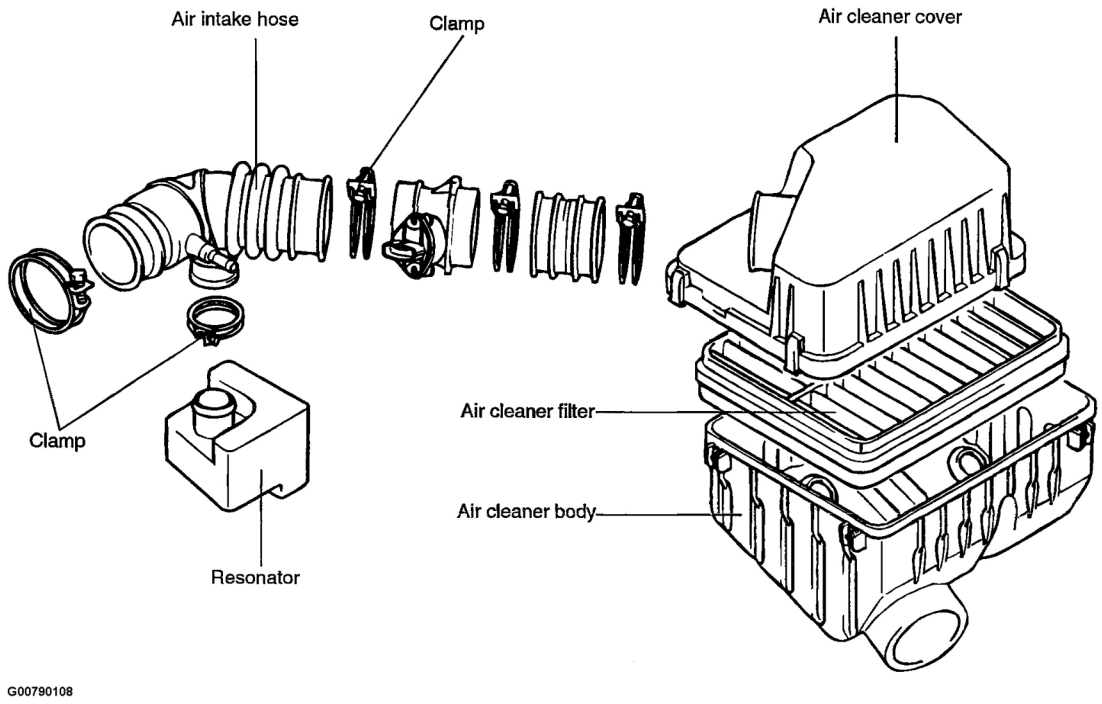

Fig. 148: Air Cleaner Components

Removal

1. Disconnect the air flow sensor connector.
2. Remove the air intake hose at the air cleaner and the resonator.
3. Remove the three bolts attaching the air cleaner mounting brackets.
4. Detach the air cleaner.

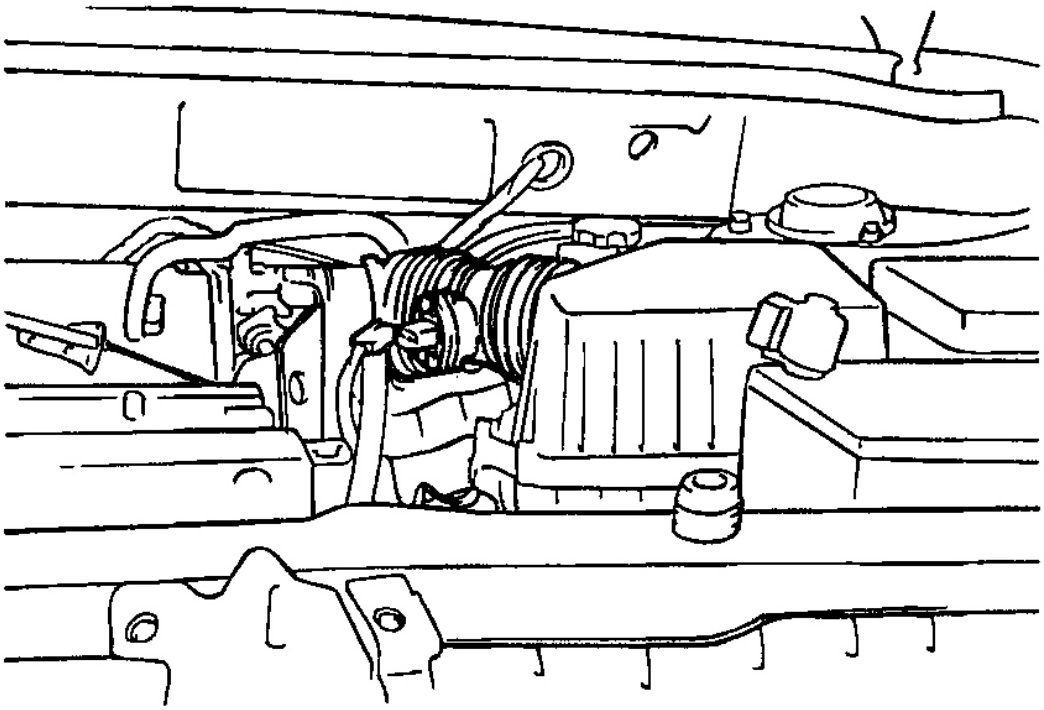

Fig. 149: View Of Air Cleaner
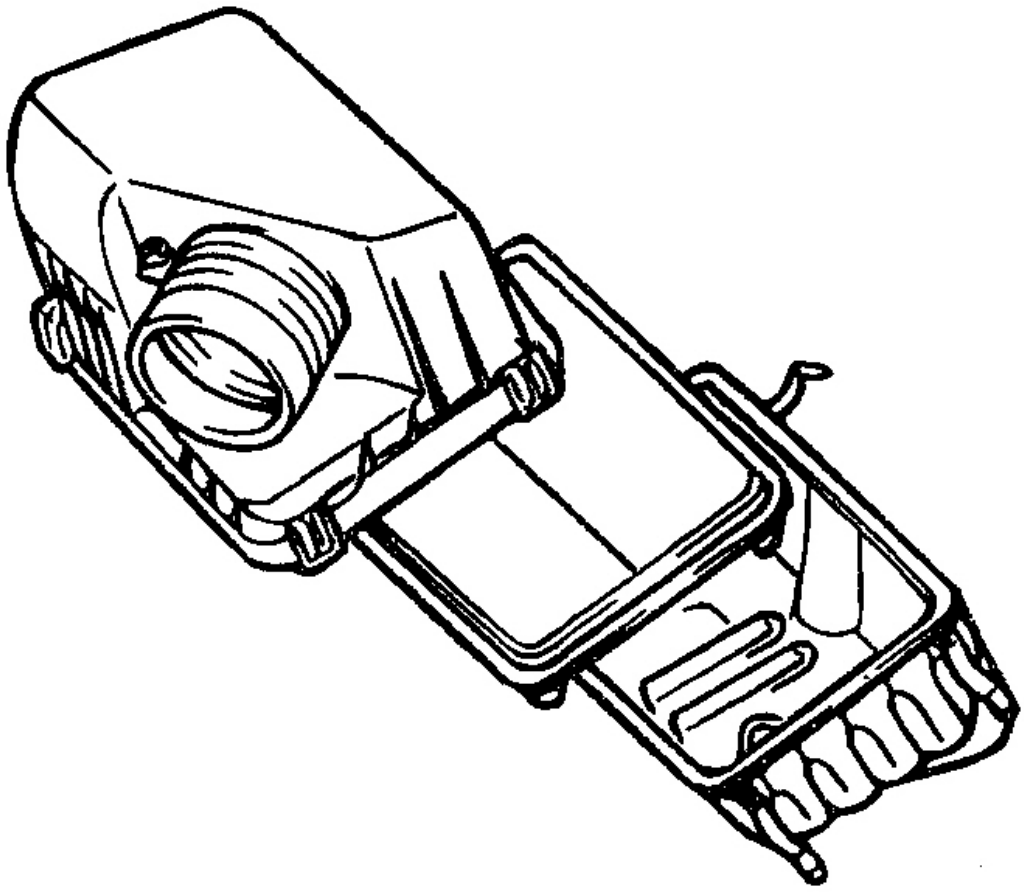
Courtesy of HYUNDAI MOTOR CO.

5. Remove the air flow sensor from the air intake hose.

CAUTION: Do not pull on the air flow sensor wires.

Inspection

1. Check the air cleaner body, cover, or filter for distortion, corrosion or damage.
2. Check the air duct for damage.



G00790110

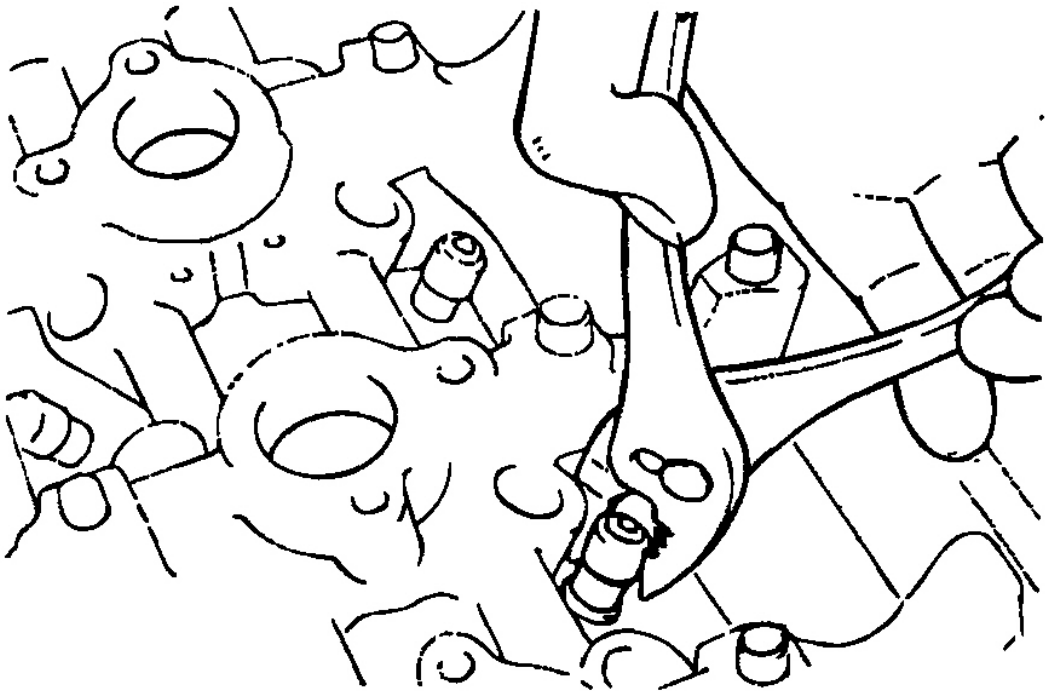
3. Remove the valve stem seals with pliers.

NOTE: Do not reuse the valve stem seals.



G00790115

Fig. 155: Removing Valve Stem Seals
Courtesy of HYUNDAI MOTOR CO.

Inspection

1. Check the cylinder head for cracks, damage and coolant leakage. If cracked, replace the cylinder head.
2. Remove scale, sealing compound and carbon deposits completely. After cleaning the oil passages, apply compressed air to verify that the passages are not clogged.

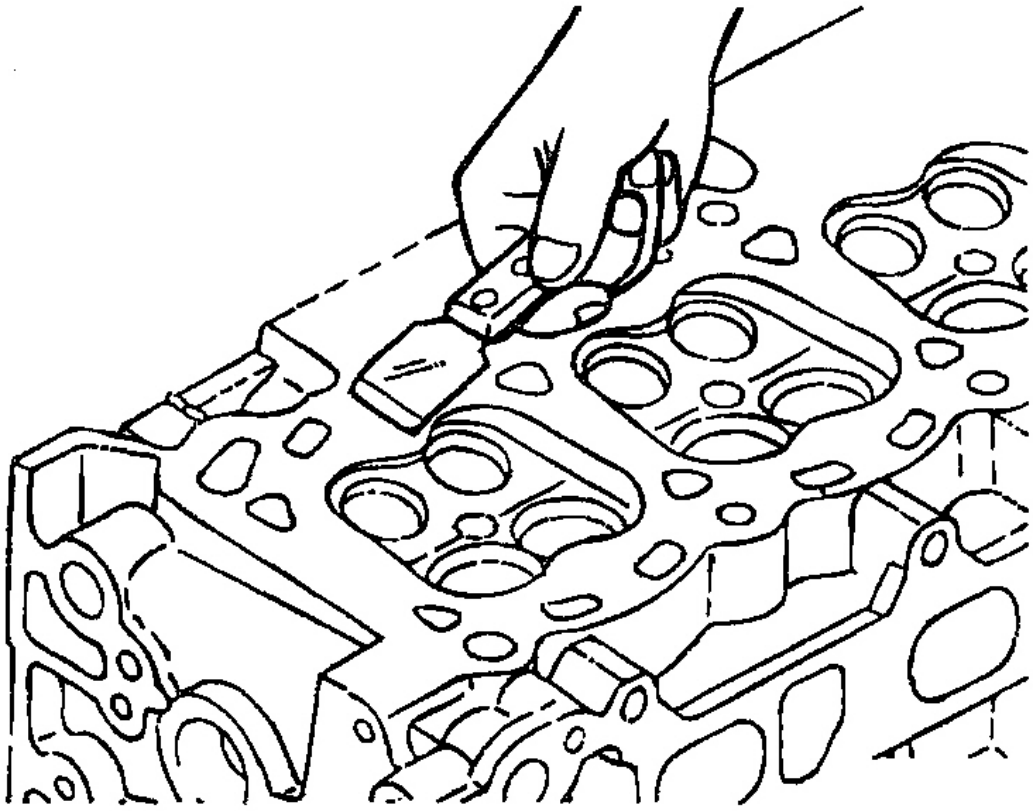


Fig. 156: Cleaning Cylinder Head Surface
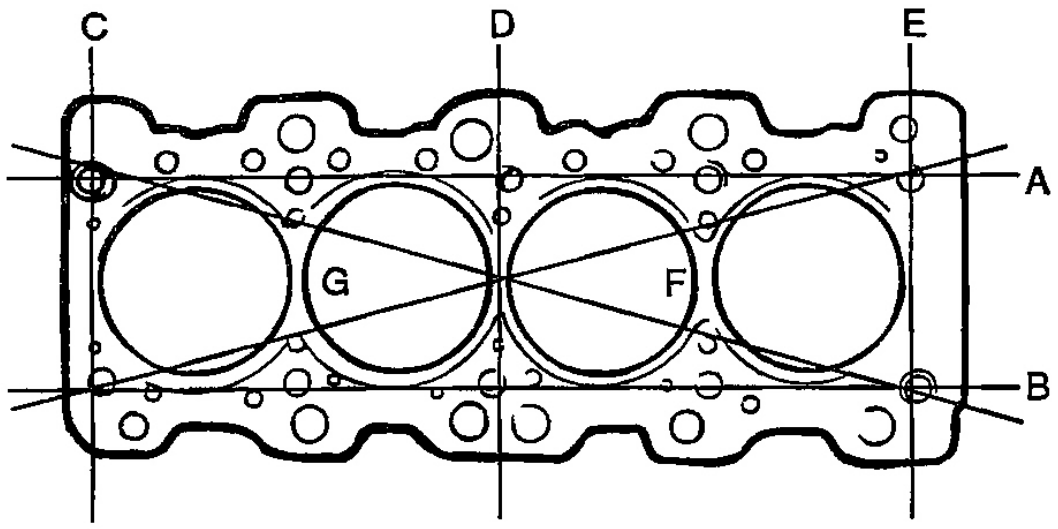
Courtesy of HYUNDAI MOTOR CO.

3. Check the cylinder head surface for flatness in the direction as shown in the illustration. If flatness exceeds service limit in any direction, either replace the cylinder head or machine the cylinder head matching surface lightly.

Flatness of cylinder head gasket surface

Standard : Less than 0.03 mm (0.0012 in.)

Limit : 0.2 mm (0.008 in.)

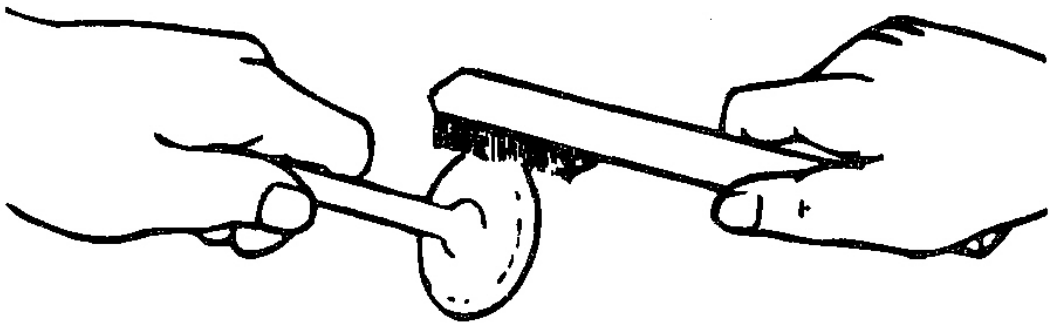


G00790117

Fig. 157: Checking Cylinder Head Flatness
Courtesy of HYUNDAI MOTOR CO.

Valves

1. Using a wire brush, clean the valve thoroughly.



G00790118

Fig. 158: Cleaning Valve
Courtesy of HYUNDAI MOTOR CO.

2. Check each valve for wear, damage and distortion of the head and the stem at B Position. Replace, if necessary. If stem end is hollowed out or worn, resurface as necessary. This correction must be limited to

a minimum. Also resurface the valve face.

Replace the valve if the margin has decreased to less than the service limit.

Margin

[Standard]

Intake : 1.0 mm (0.040 in.)

Exhaust : 1.5 mm (0.059 in.)

[Limit]

Intake : 0.7 mm (0.028 in.)

Exhaust : 1.0 mm (0.040 in.)

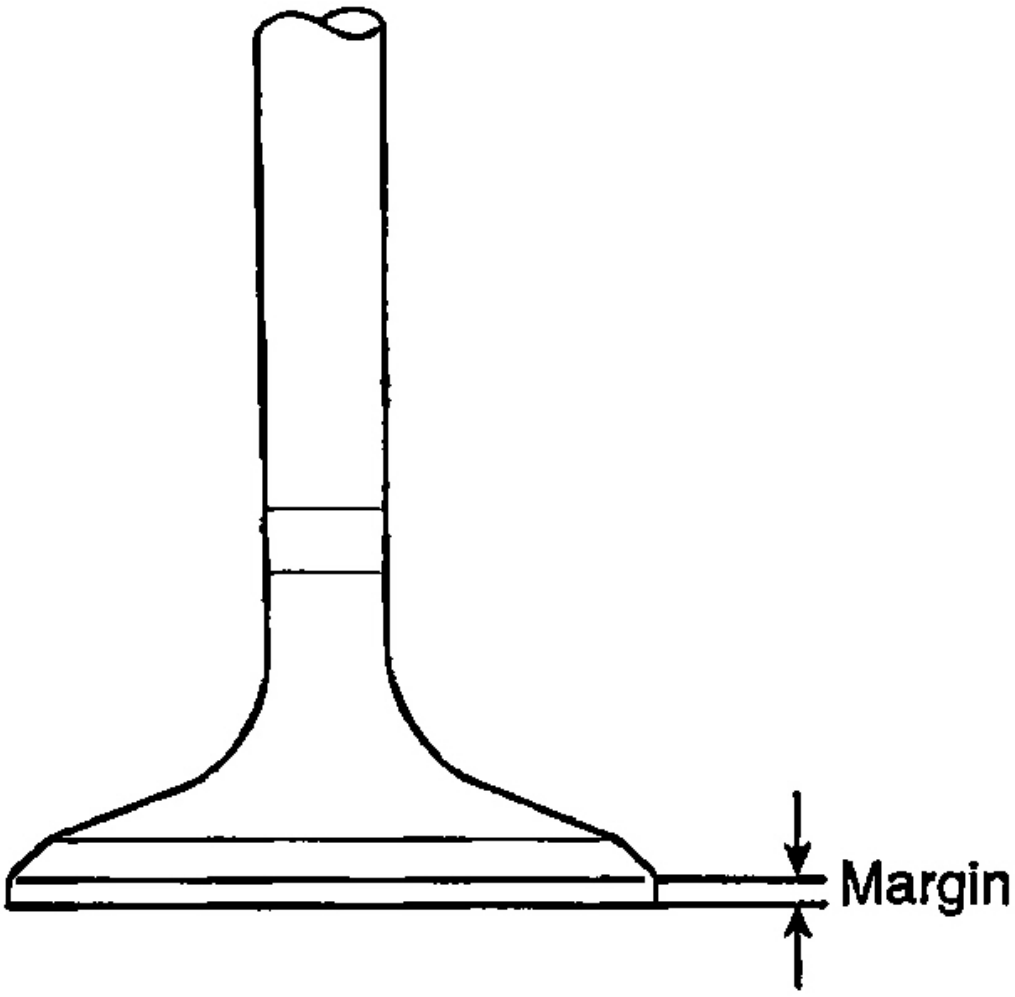


Fig. 159: Identifying Valve Margin
Courtesy of HYUNDAI MOTOR CO.

Valve Springs

1. Check the free height of each valve spring. If they exceed the service limit, replace the springs.
2. Using a square, test the squareness of each spring. If a spring is excessively out-of-square, replace it.

Valve spring

[Standard]

Free height : 45.82 mm (1.804 in.)

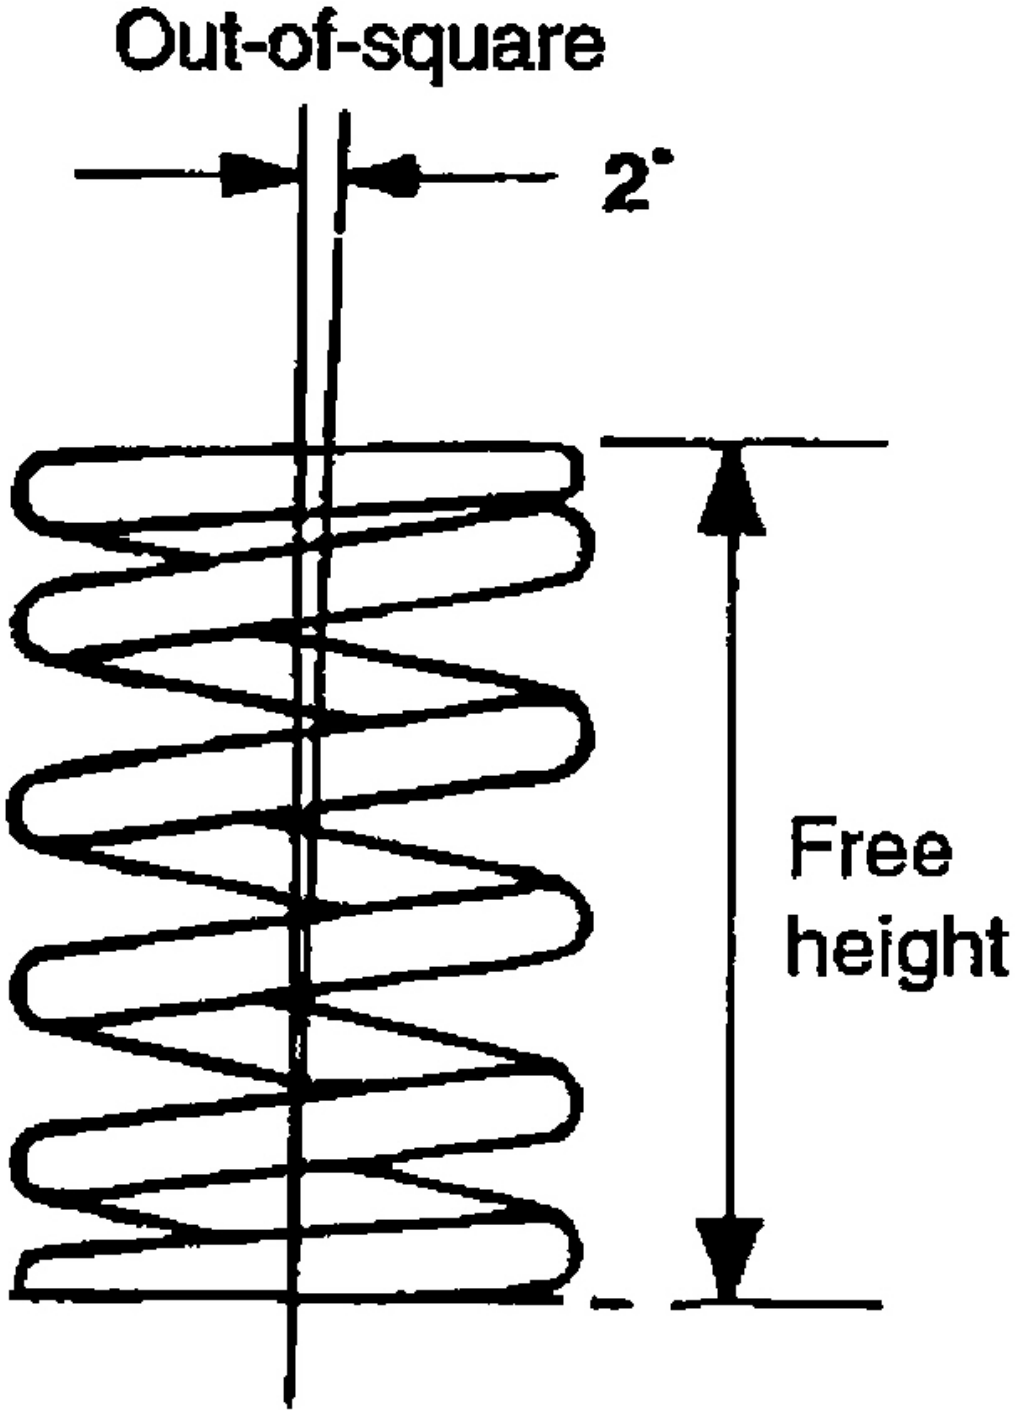
Load : 23.3kg / 40 mm (55.8 lb / 1.57 in.)

Out of square : 1.5° or less

[Limit]

Free height : 44.82 mm (1.7646 in.)

Out of square : 4°



G00790120

Valve Guides

Check the valve stem-to-guide clearance. If the clearance exceeds the service limit, replace the valve guide with the next oversize part.

Valve stem-to-guide clearance

[Standard]

Intake : 0.020 ~ 0.047 mm (0.0008 ~ 0.0020 in.)

Exhaust : 0.050 ~ 0.085 mm (0.0020 ~ 0.0033 in.)

[Limit]

Intake : 0.1 mm (0.0040 in)

Replacing Valve Seat Ring

1. Cut away the inner face of the valve seat to reduce the wall thickness.

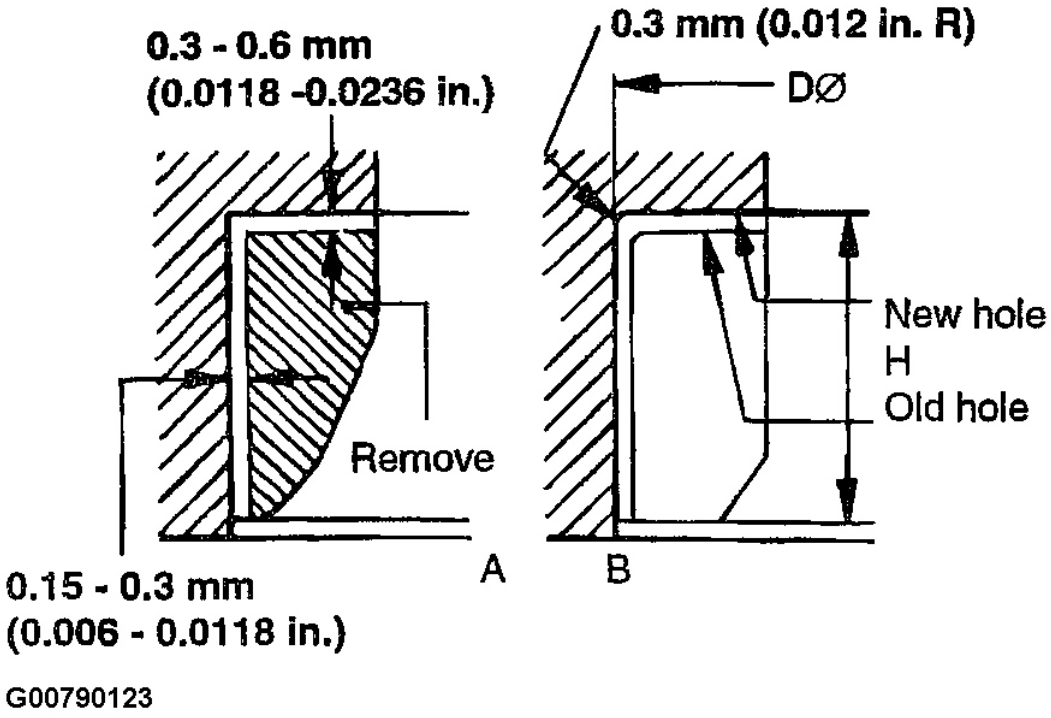

Fig. 163: Cutting Inner Face Of Valve Seat
Courtesy of HYUNDAI MOTOR CO.

2. Enlarge the diameter of the valve seat so that it matches the specified oversize hole diameter of the new valve seat ring.
3. Heat the cylinder head to about 250°C (480°F) and press-fit an oversize seat ring for the bore in the cylinder head.
4. Using lapping compound, lap the valve to the new seat.

Replacing Valve Guide

1. Using the special tool (09221-3F000 A/B), withdraw the old valve guide toward the bottom of cylinder head.
2. Recondition the valve guide hole so that it can match the newly press-fitted oversize valve guide.

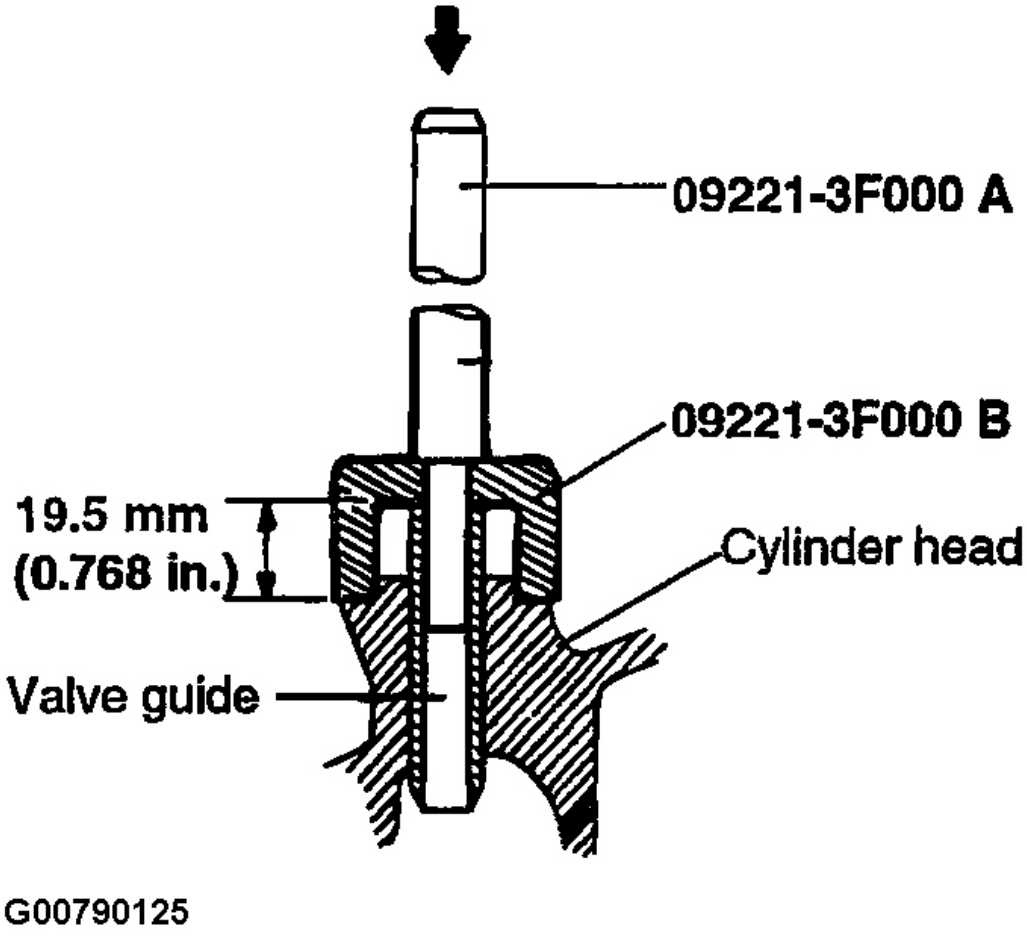

Fig. 165: Press Fit Valve Guide
Courtesy of HYUNDAI MOTOR CO.

3. Using the special tool (09221-3F000 A/B), press-fit the valve guide. The valve guide must be press-fitted from the upper side of the cylinder head. Keep in mind that the intake and exhaust valve guides are different in length.

NOTE: Do not install a valve guide unless it is oversize.

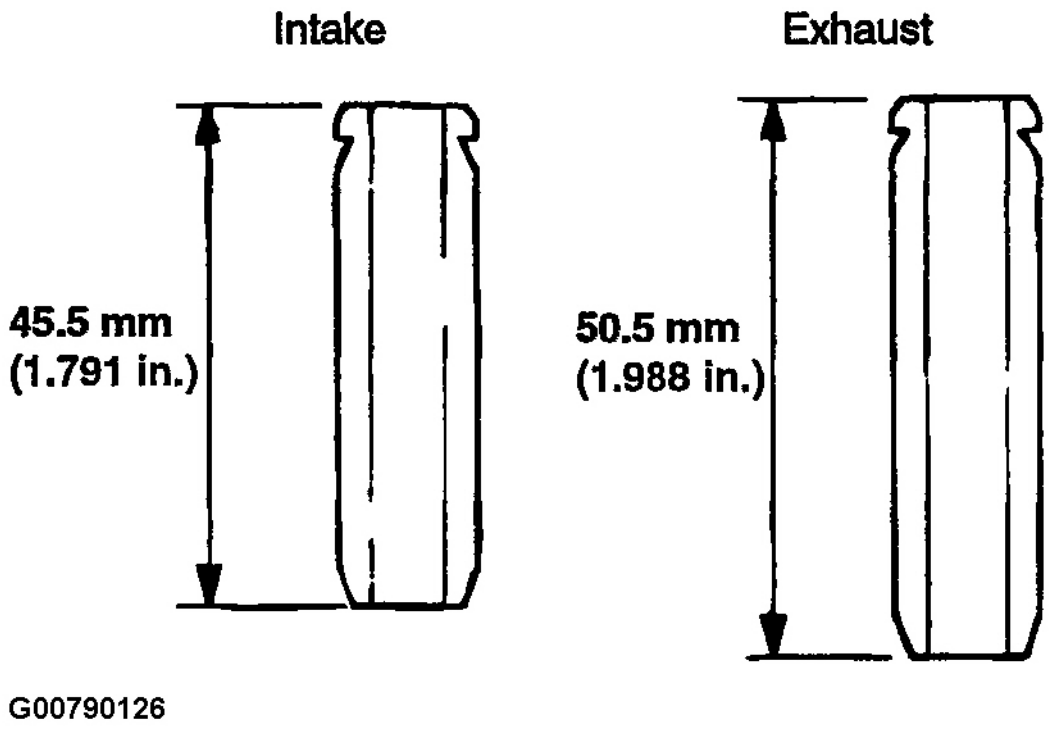

Fig. 166: Checking If Valve Is Fully Seated
Courtesy of HYUNDAI MOTOR CO.

4. After the valve guide is press-fitted, insert a new valve and check for proper stem-to-guide clearance.
5. After the valve guide is replaced, check that the valve is seated properly. Recondition the valve seats as necessary.

Reassembly

NOTE:

1. **Clean each part before assembly.**
2. **Apply engine oil to the sliding and rotating parts.**

1. Install the spring seats.
2. Using a special tool (09222-28200), tap the seal in position lightly.

NOTE:

- **Do not reuse old valve stem seals.**
- **Incorrect installation of the seal could result in oil leakage past the valve guides.**

3. Apply engine oil to each valve. Insert the valve into the valve guide. Avoid pushing the valve into the seal by force. After inserting the valve, check that it moves smoothly.

4. Place valve springs so that the side coated with enamel faces the valve spring retainer and then install the retainer.

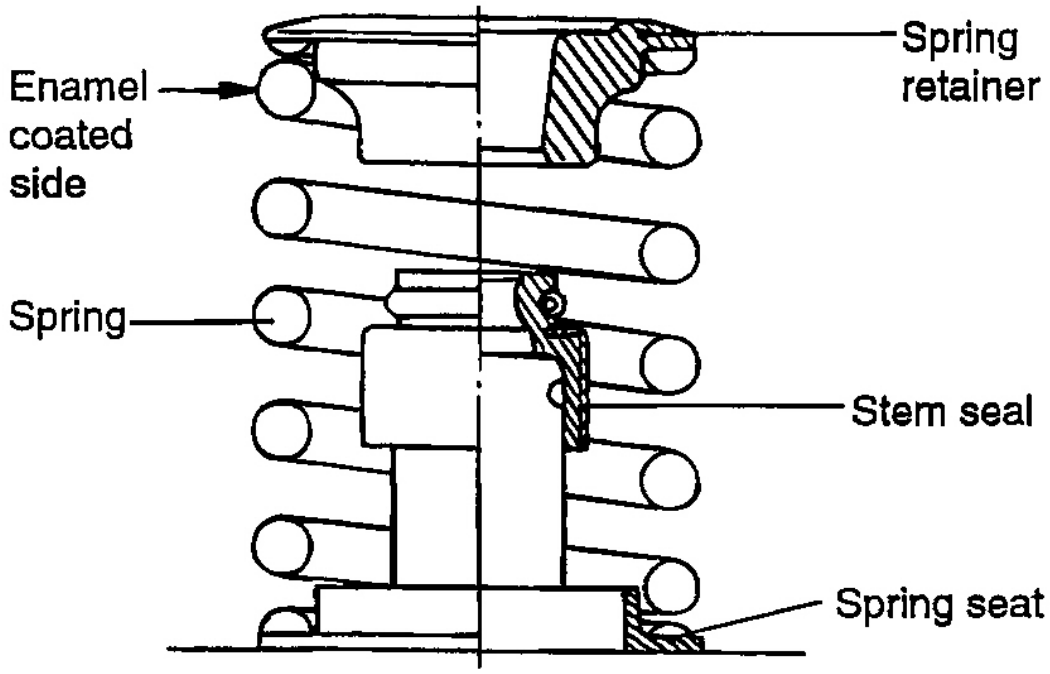

Fig. 169: Identifying Valve Spring Installation
Courtesy of HYUNDAI MOTOR CO.

5. Using the special tool (09222-28000, 09222-28100), compress the spring and install the retainer locks. After installing the valves, ensure that the retainer locks are correctly in place before releasing the valve spring compressor.

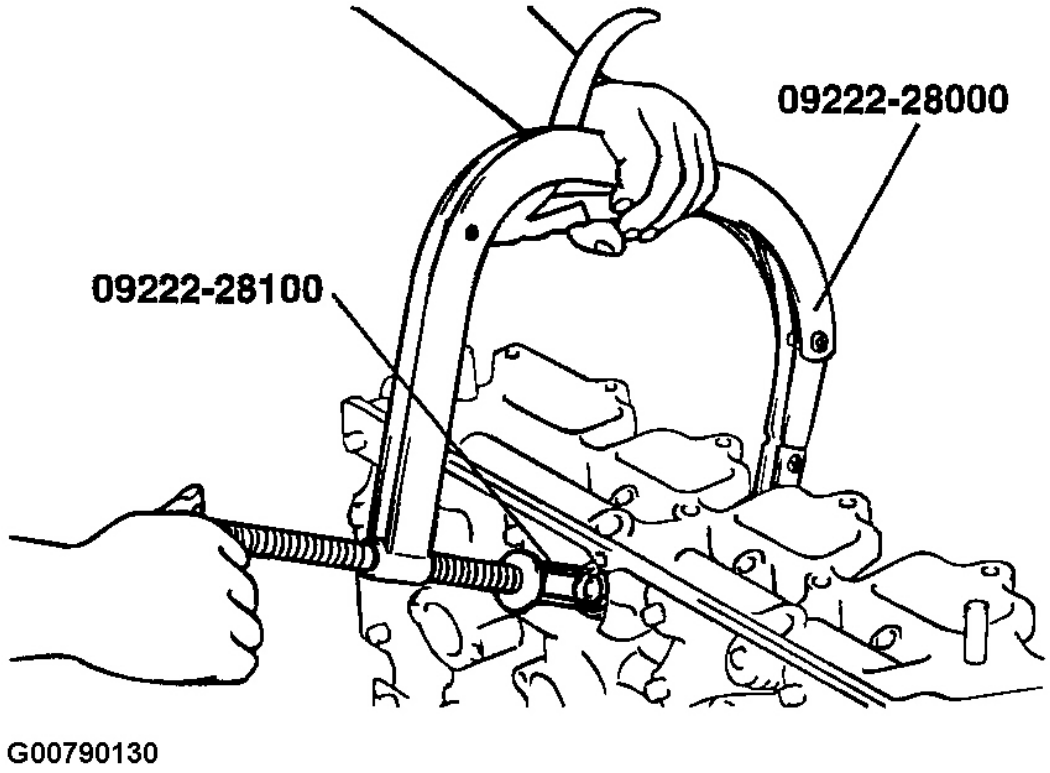

Fig. 170: Installing Valve Spring Retainer Locks

NOTE: When the spring is compressed, Check that the valve stem seal is not pressed against the bottom of the retainer.

6. Clean both gasket surfaces of the cylinder block and cylinder head.
7. Verify the identification marks on the cylinder head gasket.
8. Install the gasket so that the surface with the identification mark faces toward the cylinder head.

NOTE: Check and measure the length of each head bolt. Maximum length : 99.4 mm (3.9 in.)

9. Tighten the bolts to the specified torque.

Removal

CAUTION: Rotate the crankshaft clockwise and align the timing marks to set the No. 1 cylinder's piston to TDC.
At this time, the timing marks of the camshaft sprocket and cylinder head cover should coincide with each other and the dowel pin of the camshaft-sprocket should be at the upper side.

1. Remove the crankshaft pulley, engine coolant pump pulley and drive belt.
2. Remove the timing belt cover.
3. Remove the auto tensioner.

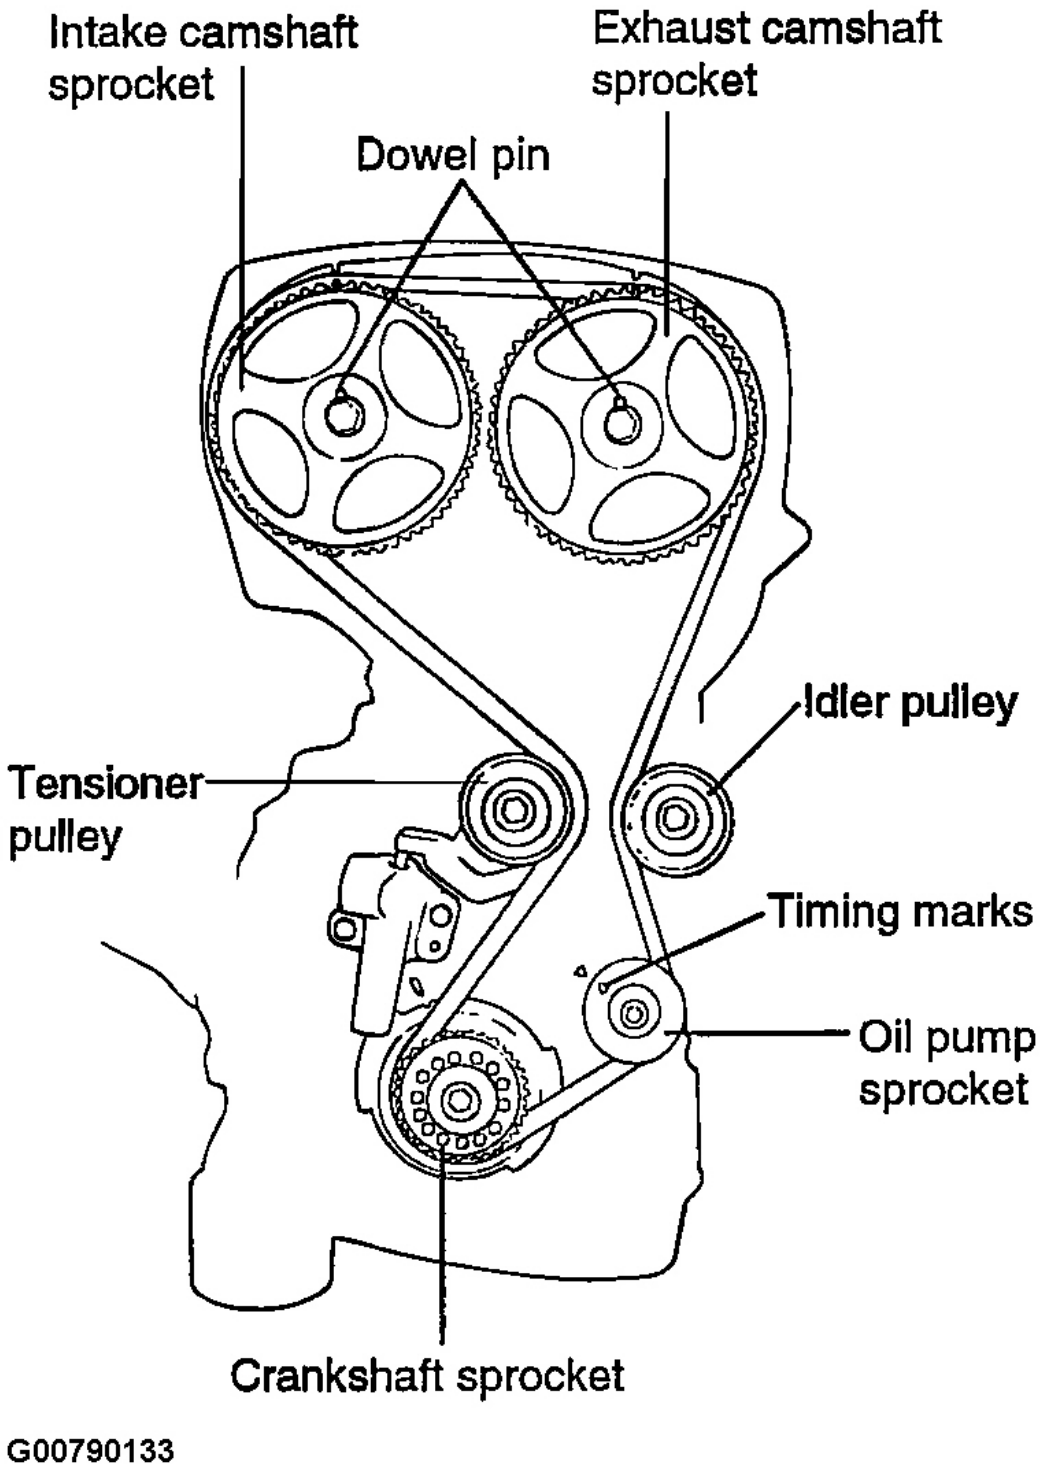

Fig. 173: Identifying Timing Belt & Pulleys

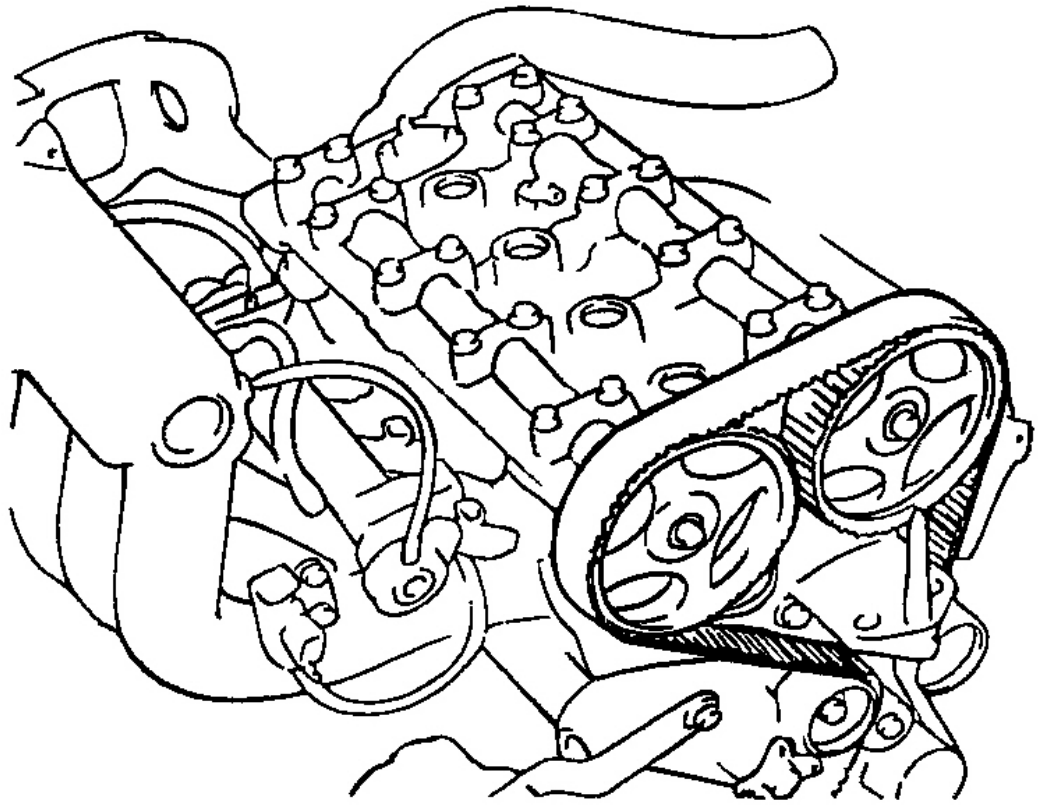
Courtesy of HYUNDAI MOTOR CO.

NOTE: If the timing belt is reused, make an arrow mark indicating the turning direction (or the front of the engine) to make sure that the belt is reinstalled in the same direction as before.
In this case the timing marks on the camshaft sprocket and on the locker cover should be aligned and the dowel pins on the camshaft sprockets should be positioned upward.

4. Remove the timing belt.



G00790134

5. Remove the camshaft sprockets.

NOTE: Be careful not to damage the cylinder head and camshaft sprocket with

the wrench.

6. When the oil pump sprocket nut is removed, first remove the plug at the left side of the cylinder block and insert a screwdriver to keep the left counter balance shaft in position. Use a screwdriver with a shaft measuring 8 mm (0.3in.) in diameter which can be inserted by more than 60 mm (2.36 in.)
7. Remove the oil pump sprocket retaining nut and the oil pump sprocket.

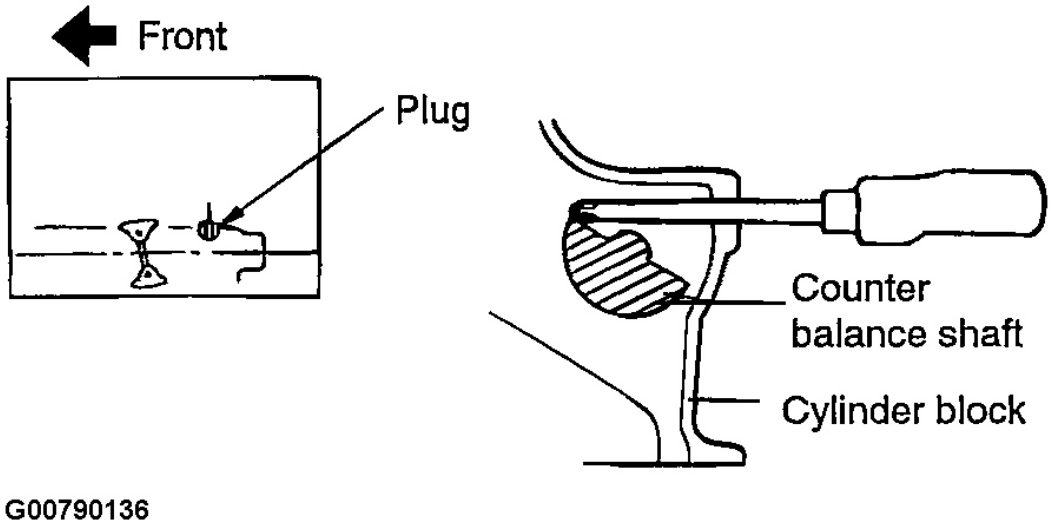

Fig. 176: Securing Counter Balance Shaft
Courtesy of HYUNDAI MOTOR CO.

8. Loosen the right counter balance shaft sprocket mounting bolt until it can be loosened by hand.
9. Next, remove the tensioner "B" and then the timing belt "B".

CAUTION: After the timing belt "B" is removed, do not attempt to loosen bolts while holding the sprocket with pliers or any other tool.

10. Remove the crankshaft sprocket "B" from the crankshaft.

Inspection

Sprockets, Tensioner Pulley & Idler Pulley

1. Check the camshaft sprocket, crankshaft sprocket, tensioner pulley and idler pulley for abnormal wear, cracks or damage. Replace if necessary.
2. Inspect the tensioner pulley and the idler pulley for easy and smooth rotation and check for play or noise. Replace if necessary.
3. Replace the pulley if there is a grease leak from its bearing.

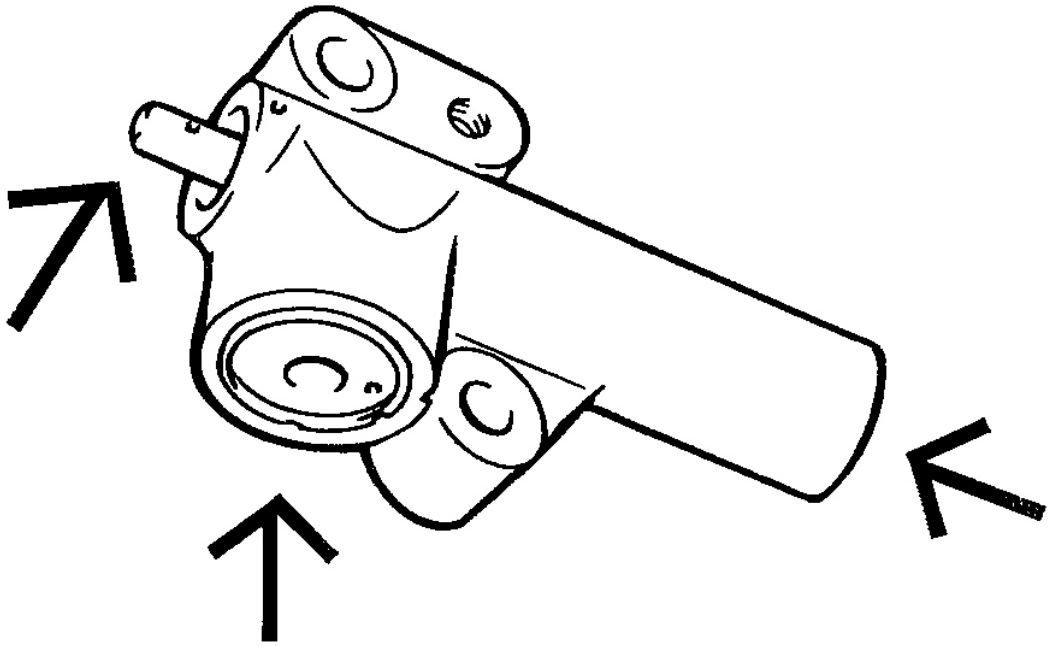
Auto Tensioner

1. Check the auto tensioner for leaking and replace if necessary.
2. Check the rod end for wear or damage and replace if necessary.



G00790139

Fig. 179: Identifying Auto Tensioner

3. Measure the rod protrusion. If it is out of specification, replace the auto tensioner.

   Standard value : 14.5 mm (0.57 in)

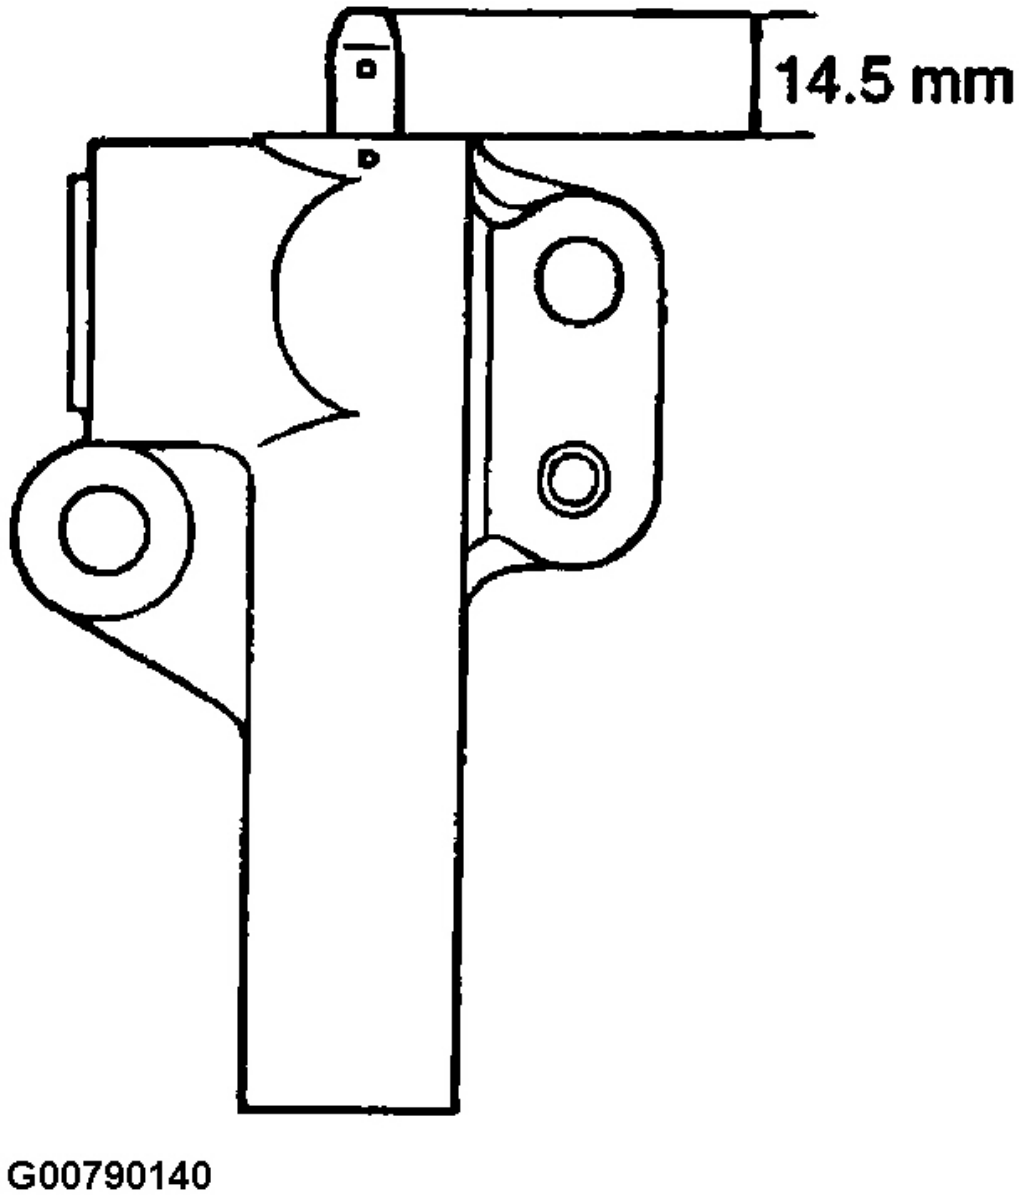

Fig. 180: Measuring Rod Protrusion

4. Using a soft jaw vise , compress the auto tensioner rod. slowly. If the rod can be easily retracted, replace the auto tensioner. You should feel extensive resistance when pushing the rod in. And it must be compressed in several steps.

NOTE: Clamp the auto tensioner in the vise so that it is level. Use soft jaws in the vise to avoid damaging the auto tensioner.

Timing Belt

1. Check the belt for oil or dust deposit. Replace if necessary. Small deposits should be wiped away with a dry cloth or paper. Do not clean with solvent.
2. When the engine is overhauled or belt tension is adjusted, check the belt carefully. If any of the following flaws are evident, replace the belt with a new one.

Description	Flaw conditions
1. Hardened back surface of rubber	Back surface is glossy, Non-elastic and so hard that, when your fingernail is pressed into it, no mark is produced. 2. Cracked back surface of rubber

Installation

1. Install the crankshaft sprocket "B" into the crankshaft.

CAUTION: Pay attention to the direction of the flange. if it is installed in the wrong direction, a broken belt could result.

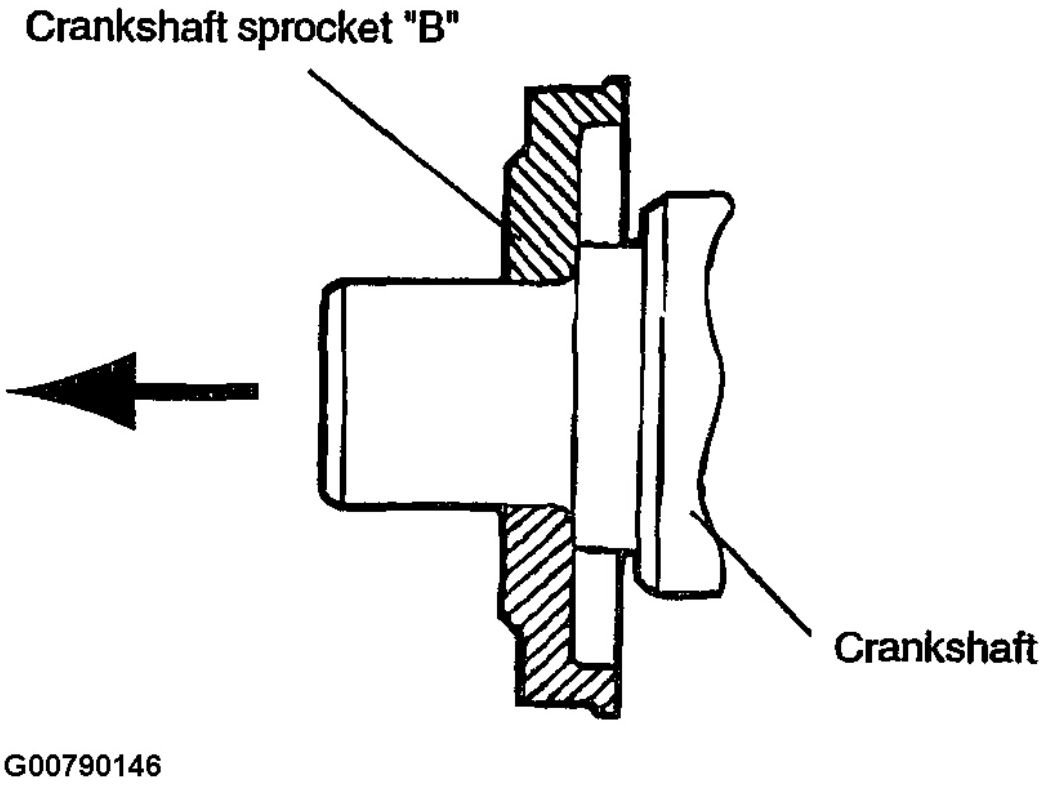

Fig. 185: Identifying Crankshaft Sprocket "B"
Courtesy of HYUNDAI MOTOR CO.

2. Apply engine oil to the outer surface of the spacer lightly and then install the spacer to the right counter balance shaft. Be sure to install in the direction shown in the illustration.
3. Install the counter balance shaft sprocket onto the right counter balance shaft and then tighten its flange bolt by hand tightly.

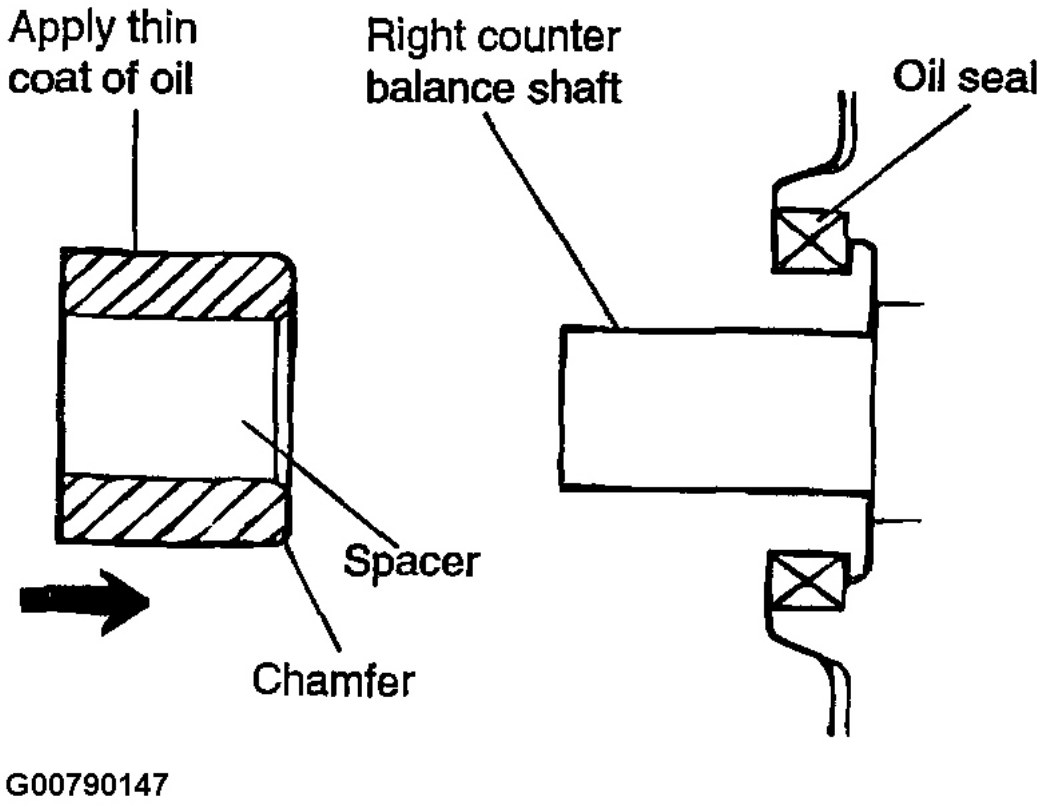

Fig. 186: Installing Counter Balance Shaft
Courtesy of HYUNDAI MOTOR CO.

4. Align the timing mark on each sprocket with the corresponding timing mark on the front case.

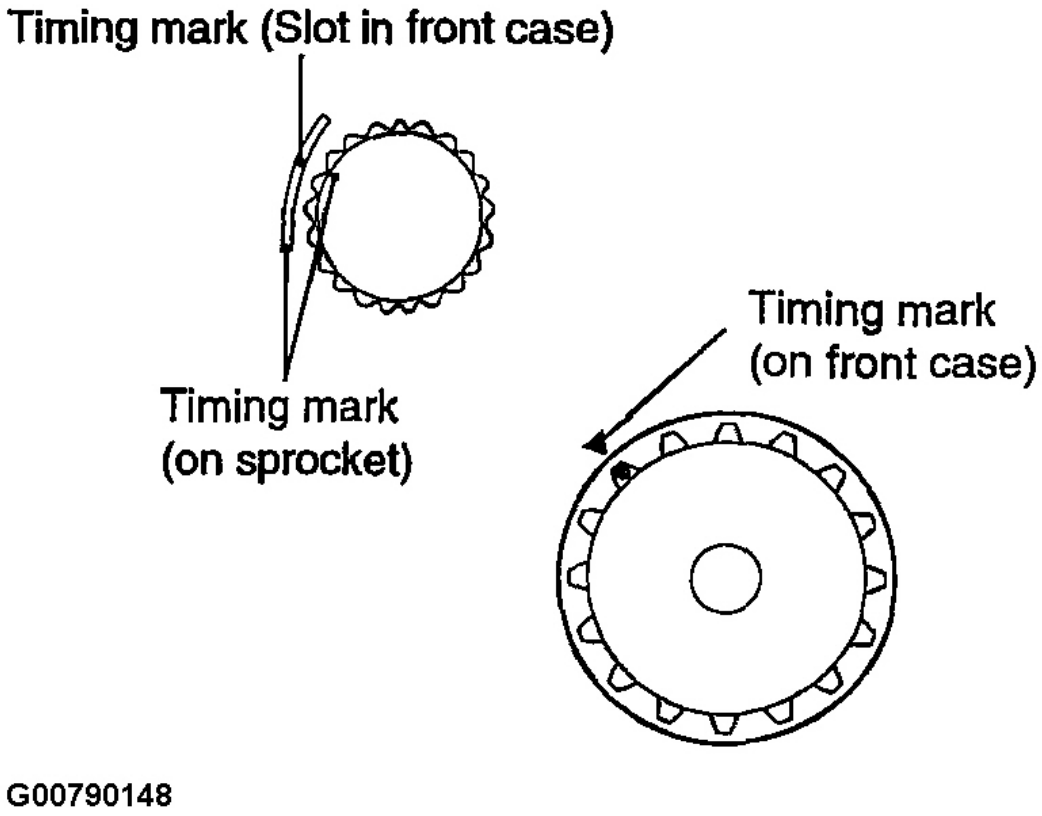

Fig. 187: Identifying Timing Marks
Courtesy of HYUNDAI MOTOR CO.

5. When the timing belt "B" is installed, make certain that its tension side has no slack.

   Install the tensioner "B" so the center of the pulley is located on the left side of the mounting bolt and in the pulley flange faces the front of the engine.

   Align the timing mark on the right counter balance shaft sprocket with the timing mark on the front case.

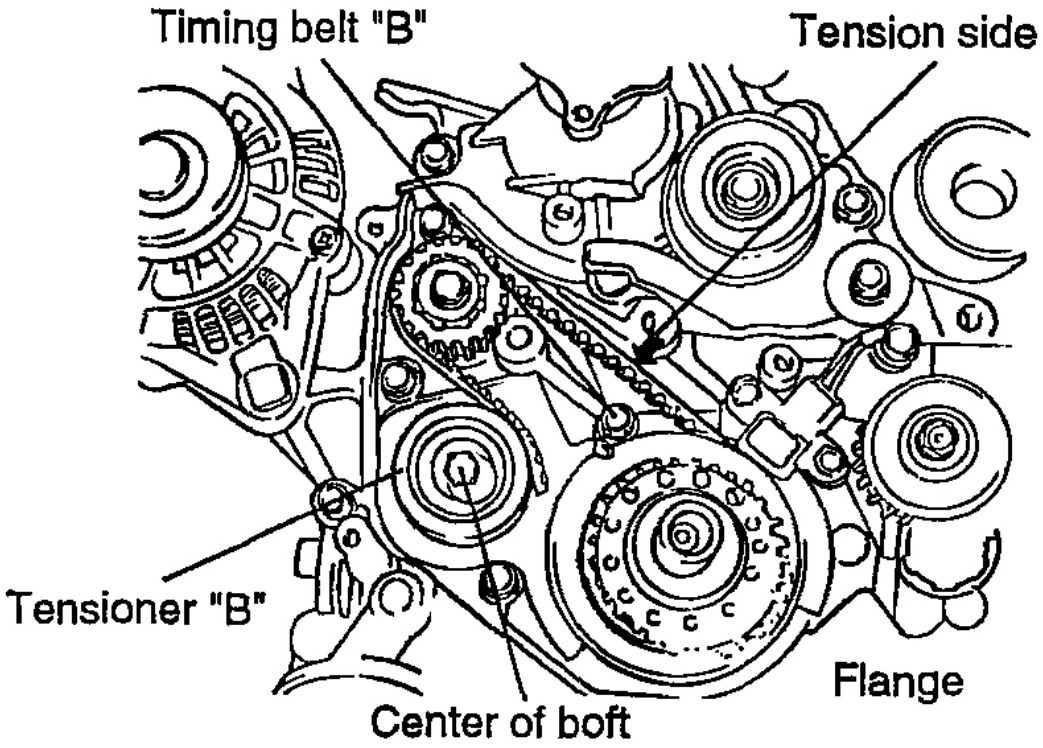

Fig. 188: Installing Timing Belt "B"
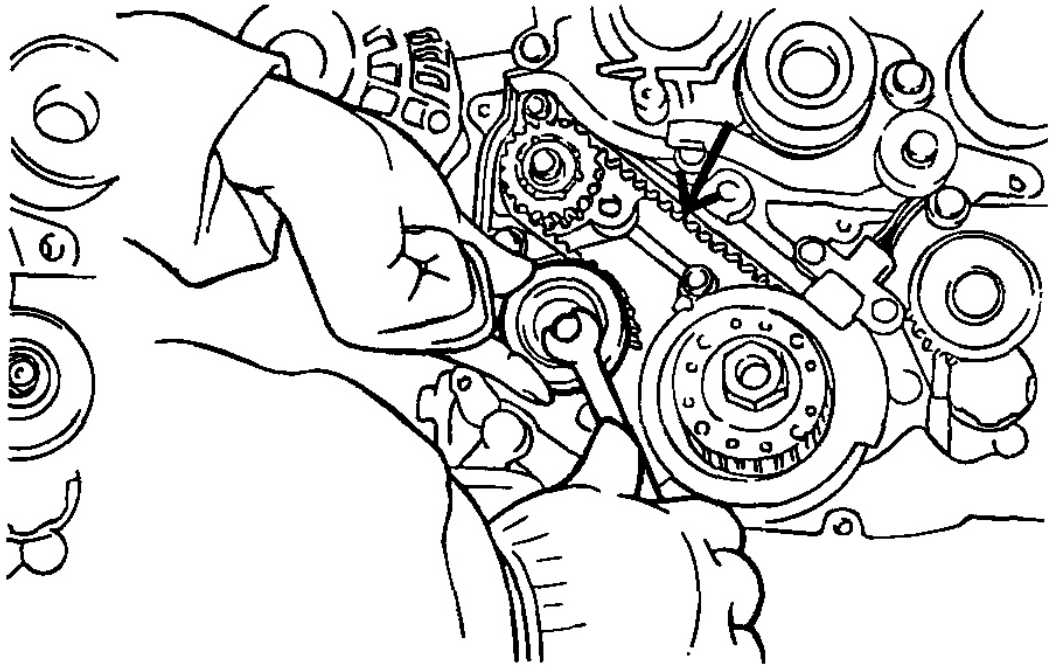
Courtesy of HYUNDAI MOTOR CO.

6. Lift the tensioner "B" to tighten the timing belt "B" so that its tension side is pulled tight. In this condition, tighten the bolt to secure tensioner "B". As the bolt is tightened, be careful to prevent the shaft from turning. If the shaft is turned, the belt will be tightened excessively.



G00790150

Fig. 189: Tightening Tensioner "B"

7. Check to ensure that the timing marks are in alignment.
8. Verify the tension of the timing belt.

   Method 1 : Verify that, when the center of the span on the tension side is depressed with an index finger in the direction of arrow, the deflection of the belt is within specification.

   Belt deflection : 5 ~ 7 mm (0.20 ~ 0.28 in)

   Method 2 : Measure the tension of the timing belt by using a tension gauge.

Span length	Pressure	Torque
139mm (5.47 in.)	0.42 kg/cm² (42 kPa)	50 ~ 100Nm (500 ~ 1000kg.cm, 36 ~ 72 lb.ft)

9. Install the flange and crankshaft sprocket onto the crankshaft. Be sure to install the as shown in the illustration.

CAUTION: Pay attention to the direction of the flange. If it is installed in the wrong direction, a broken belt could result.

10. Install the special washer and sprocket bolt to the crankshaft and then tighten the sprocket bolt.

Tightening torque

Crankshaft sprocket bolt :

160 ~ 170 Nm (1600 ~ 1700 kg.cm, 116 ~ 123 lb.ft)

11. Insert a screwdriver through the plug hole in the left side of the cylinder block to keep the shaft in position.

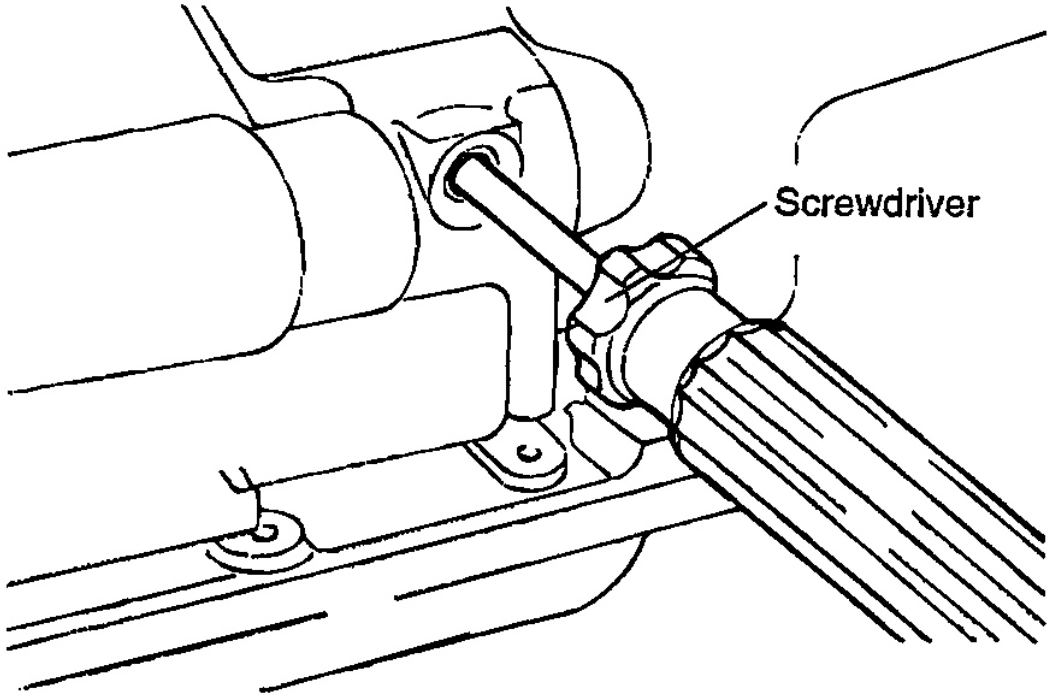

Fig. 193: Identifying Screw Driver In Plug Hold

Tightening torque

Oil pump sprocket

50 ~ 60 Nm (500 ~ 600 kg.cm, 36 ~ 43 lb.ft)

13. Install the camshaft sprocket and tighten the bolt to the specified torque.

Tightening torque

Camshaft sprocket bolt :

80 ~ 100 Nm (800 ~ 1000 kg.cm, 58 ~ 72 lb.ft)

14. Install the auto tensioner.

CAUTION: Leave the set pin installed in the auto tensioner.

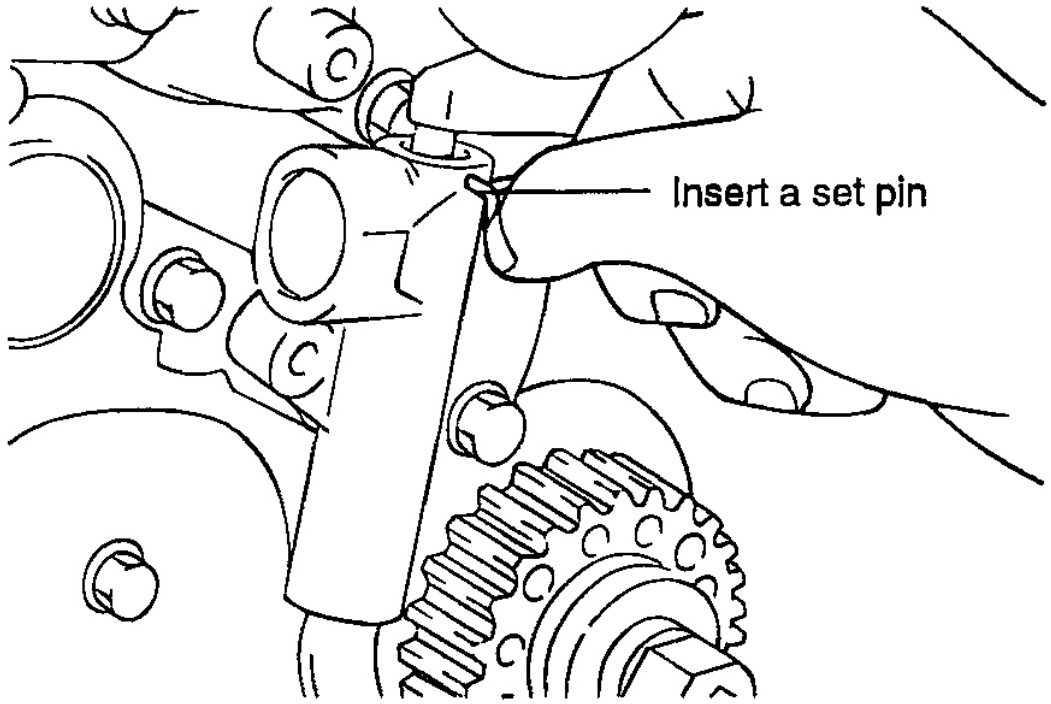

Fig. 195: Installing Auto Tensioner
Courtesy of HYUNDAI MOTOR CO.

NOTE: If the auto tensioner rod is in its fully extended position, reset it as follows.

1. **Clamp it in a vise equipped with soft jaws, in a level position. Use a plain washer if there is a plug at the bottom of the auto tensioner.**
2. **Compress the rod slowly with the vise until the set hole in the rod is aligned with set hole in the cylinder.**

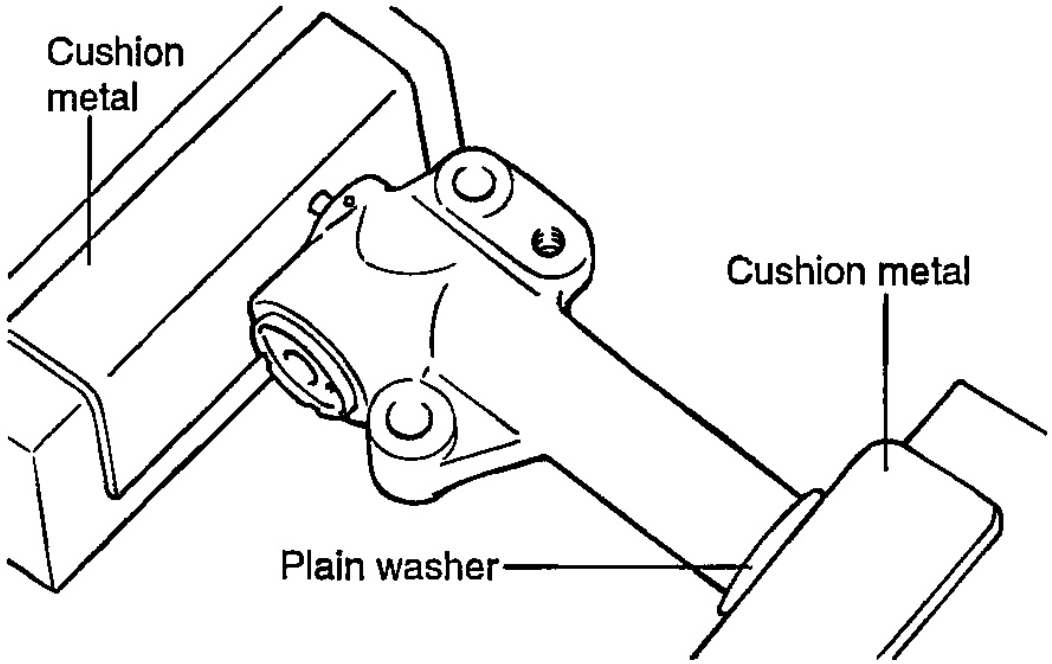

Fig. 196: Compressing Rod In A Vise
Courtesy of HYUNDAI MOTOR CO.

3. **Insert a set pin through the auto tensioner body and rod.**

CAUTION: Leave the set pin installed in the auto tensioner.

15. Install the tensioner pulley onto the tensioner arm.

Tightening torque

Tensioner pulley

43 ~ 55 N.m (430 ~ 550 kg.cm, 31 ~ 40 lb.ft)

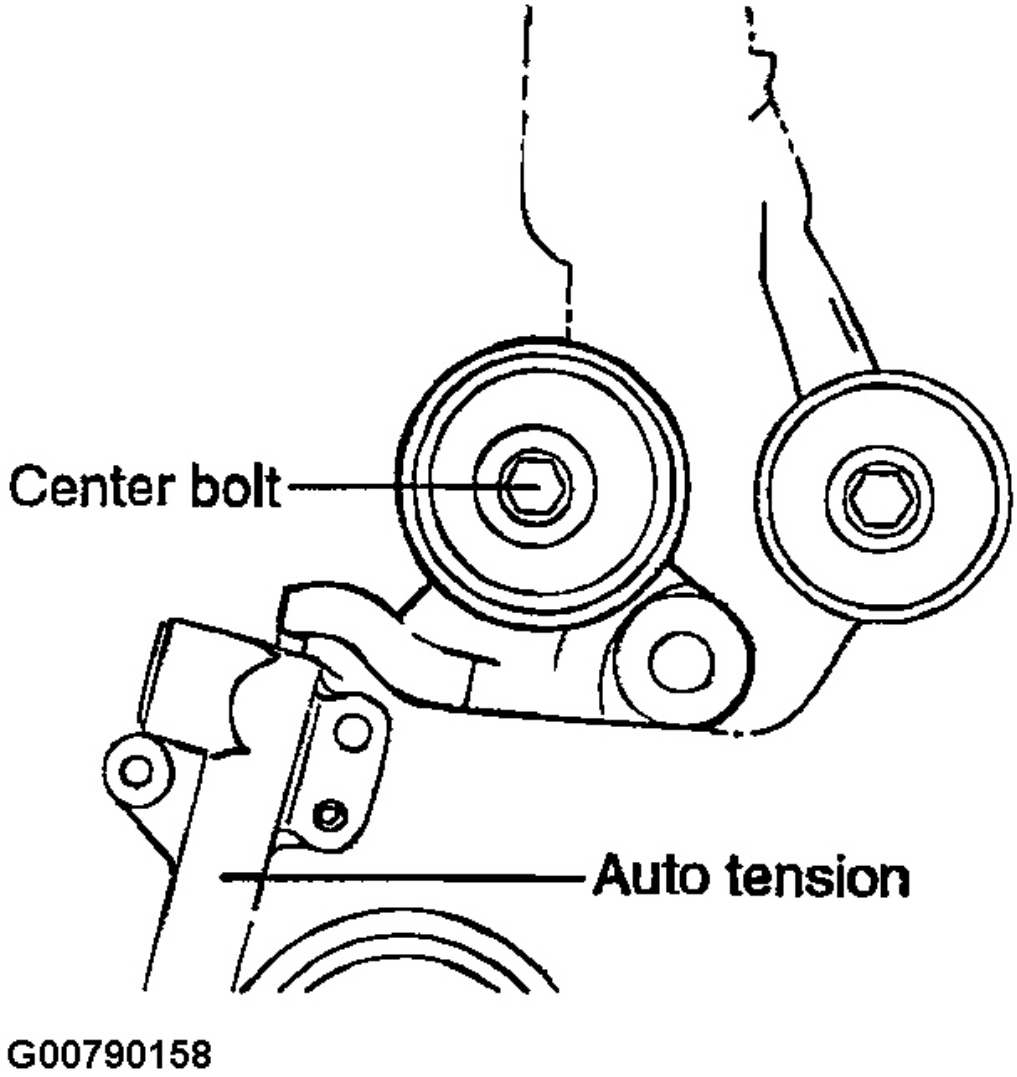

Fig. 197: Identifying Tensioner Pulley

16. Rotate the camshaft sprockets so that the dowel pin of the camshaft sprocket is at the upper side. Set the timing mark of sprocket correctly.

NOTE:

1. **Before installing the timing belt, if the timing mark of the cam sprocket doesn't coincide with that of the rocker cover, do not rotate the cam sprocket more than 2 teeth of the sprocket in any direction. Rotating the sprocket more than 2 teeth may make the valve and piston touch each**

other.

2. If it is necessary to rotate the cam sprocket more than 2 teeth, rotate the crank sprocket counter clock wise first based on the timing mark.

   After the cam sprocket is properly timed return the crankshaft to TDC.

17. Align the timing mark on each sprocket with the corresponding timing mark and install the belt as the following order.

    Crankshaft sprocket - Oil pump sprocket - Idler pulley - Exhaust camshaft sprocket - Intake camshaft sprocket Tensioner pulley

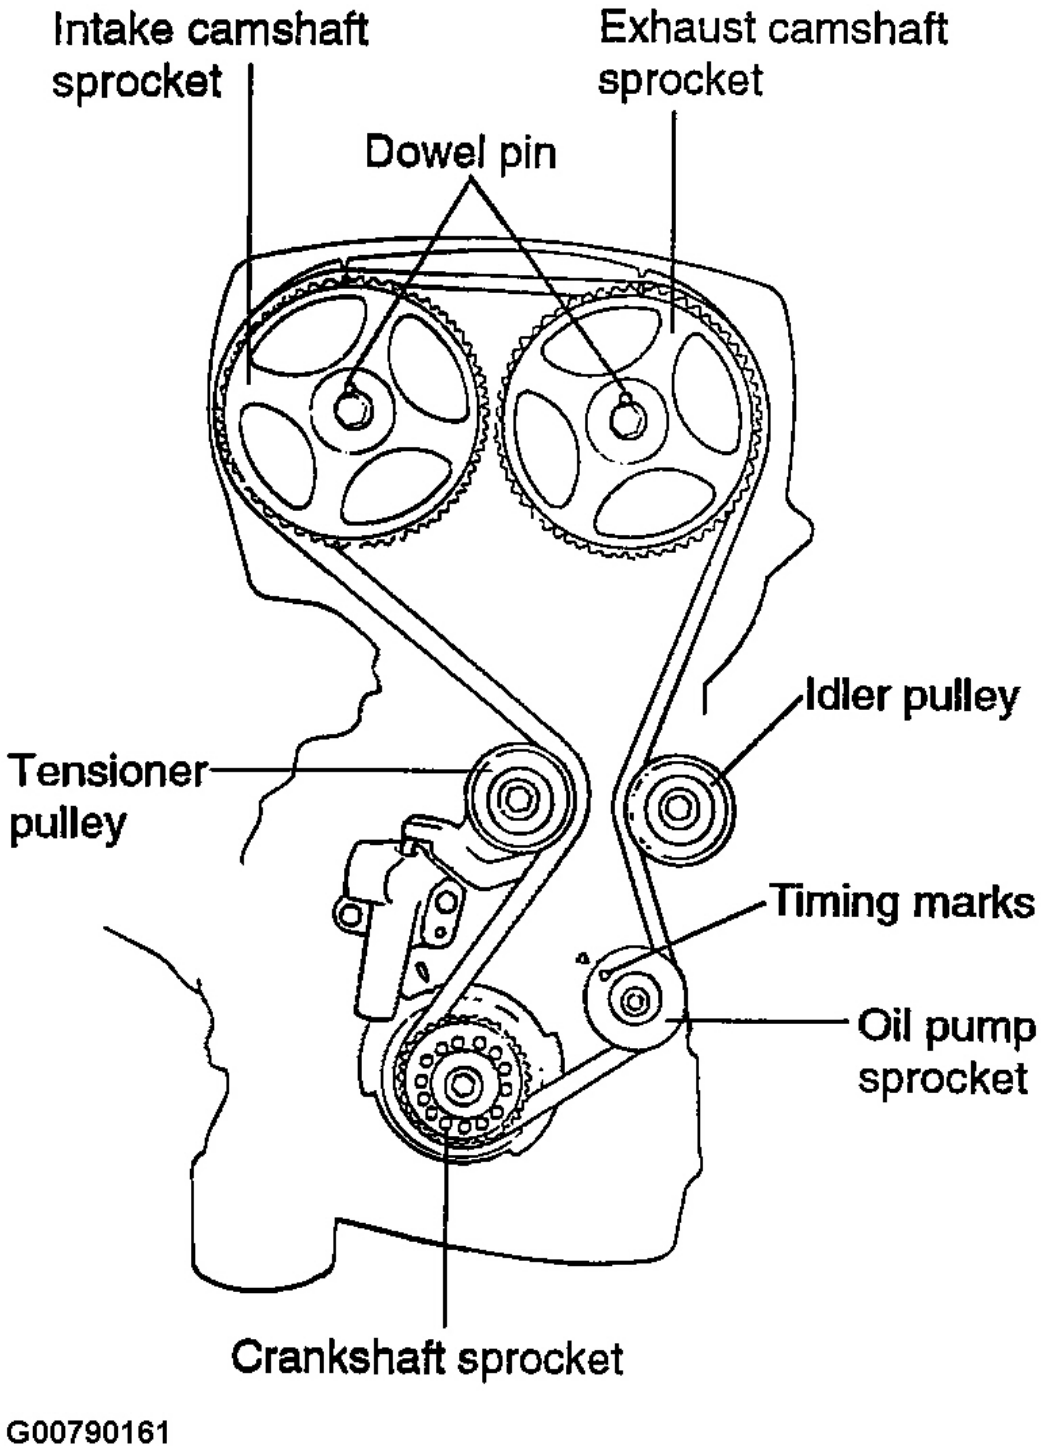

Fig. 200: Identifying Timing Belt & Pulleys

NOTE:

1. **Be sure that the piston of No. 1 cylinder is located in TDC position (Compression stroke).**
2. **When aligning the timing mark on oil pump sprocket, remove the left plug of cylinder block, and then check that the count balance shaft is in the specified position by inserting the screwdriver (Diameter : 8 mm, inserting length : 60 mm or more)**

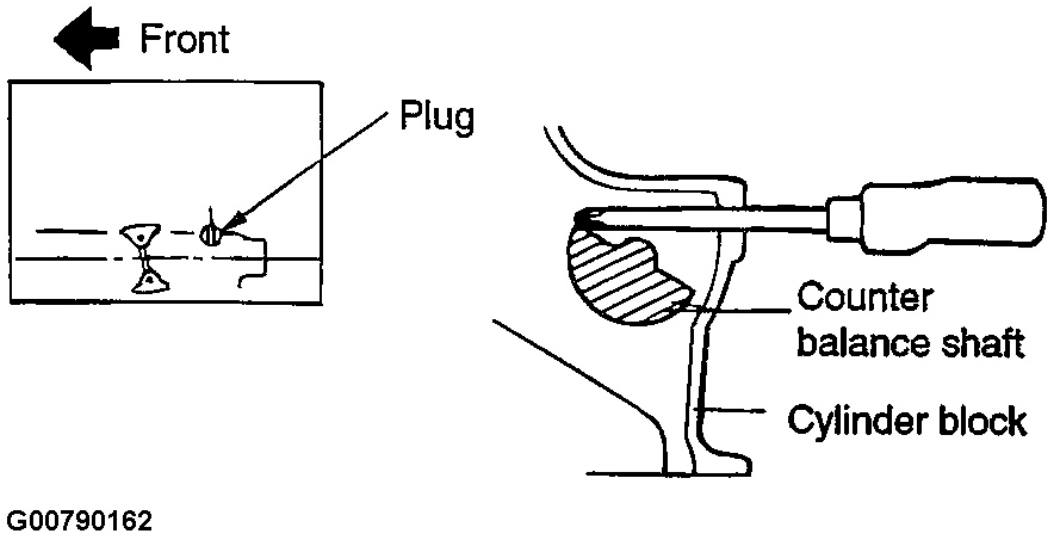

Fig. 201: Checking Counter Balance Shaft Position
Courtesy of HYUNDAI MOTOR CO.

3. **After checking the timing mark, install the left plug of cylinder block.**

   Tightening torque : 2.7 - 3.4 kgf.m

   (Apply the liquid gasket : THREE BOND NO. 1212B or equivalent)

18. Pull out the set pin.
19. Rotate the crankshaft two turns clockwise and leave it for about 5 minutes. Then, measure the auto tensioner protrusion "A" (Distance between the tensioner arm and auto tensioner body) to ensure that it is within the specification.

    Standard value : 5.5-9 mm (0.22 - 0.35 in)
