RON		98 * See note
Fuel injection and ignition system		Bosch Motronic
Ignition sequence		1-5-4-8-6-3-7-2
Exhaust gas recirculation (EGR)		No
Charging		No
Knock control		Yes
Variable valve timing		Yes
Variable intake manifold		Yes
Secondary air injection (AIR) system		Yes

*Super unleaded RON 95 is permissible, but with reduced power.

SAFETY PRECAUTIONS

Safety precautions

Note the following when working on the fuel system:

CAUTION: There is a risk of injury because the fuel is under high pressure.

- To reduce pressure in fuel system, lay a clean cloth around the connector and carefully loosen connector.

To prevent personal injury and damage to the injection and ignition system, observe the following:

- The ignition must be switched off before connecting or disconnecting injection and ignition system wiring or tester cables.
- Only clean engine with ignition switched off.
- If electrical connectors were disconnected, faults are saved in ECM:
 - Connect Vehicle Diagnosis, Testing and Information System VAS 5051B.
 - Start "Guided Functions" operating mode.
 - Generate readiness code in ECM.

CAUTION: Risk of destroying electrical components when battery is disconnected.

- Observe measures when disconnecting battery.
- Only disconnect battery with ignition switched off.

- Disconnect battery -->
 - 27 BATTERY, STARTER, GENERATOR, CRUISE CONTROL
 - 27 BATTERY, STARTER, GENERATOR, CRUISE CONTROL for ELECTRICAL EQUIPMENT, CABRIOLET

Note the following when working on the cooling system:

CAUTION: Risk of scalding due to hot steam and hot coolant.

- When the engine is warm the cooling system is under pressure.
- To reduce pressure, cover coolant reservoir cap with cloth and carefully open.

If it is necessary to use testing and measuring devices on road tests, observe the following:

CAUTION: Risk of accident due to distraction and testing and measuring instruments not be sufficiently secured.

Risk of passenger airbag deploying in an accident.

- Operating testing and measuring equipment while driving creates a distraction.

- **There is an increased risk of injury due to unsecured testing and measuring equipment.**
- **Always secure testers on the rear seat with a strap and have a second person on the rear seat to operate them.**

GENERAL REPAIR NOTES

Rules for cleanliness

Even a little contamination can lead to faults. Therefore when working on the fuel supply and injection system, pay careful attention to the following rules of cleanliness:

- Before loosening, connections and surrounding areas must be cleaned thoroughly with engine or brake cleaner, and then cleaned area must be dried completely.
- Seal open lines and connections immediately using suitable protective caps.
- Place parts that have been removed on a clean surface and cover them. Use lint-free cloths.
- Only install clean components: Only unpack replacement parts immediately prior to installation. Do not use parts that have been stored unpackaged (e.g. in tool boxes etc.).
- Carefully cover over opened components or seal, if repairs are not performed immediately.
- When system is open: Do not work with compressed air. Do not move vehicle unless absolutely necessary.
- Protect disconnected electrical connectors from dirt and moisture and only connect if dry.

Fuel supply system, checking for leaks

- Let engine run a few minutes at average RPM.
- Switch off ignition.
- Check entire fuel supply system for leaks.
- If there are leaks in spite of correct tightening torque, the corresponding component must be replaced.

Contact corrosion!

Contact corrosion can occur if appropriate connecting elements (bolts, nuts, washers, etc.) are not used.

For this reason, only install connecting elements that are treated with a special coating.

Also, rubber or plastic parts and adhesive consist of non-conductive materials.

If there are doubts about the suitability of parts, generally use new parts .

NOTE:

- **Only original replacement parts are recommended, they are checked and compatible with aluminum.**
- **Audi accessories are recommended.**

- Damage due to contact corrosion is not covered by warranty.

Engine (vehicles with manual transmission), installing

NOTE:

- During assembly, replace self-locking nuts and bolts.
 - Always replace bolts that are tightened to torque as well as sealing rings, gaskets and O-rings.
 - Secure all hose connections using hose clamps appropriate for the model type .
 - During installation, re-install all heat insulation sleeves at the same locations.
 - During installation, all cable ties must be re-installed at the same location.
- When installing a new clutch disc in combination with a used SAC clutch pressure plate (self-adjusting pressure plate), the adjustment ring of the pressure plate must be turned back to impact. Otherwise the pressure plate works with decreased contact pressure (clutch slips) --> **30 CLUTCH** .

NOTE:

- If clutch disc is not being replaced, the adjustment ring must not be turned back.
 - New SAC-pressure plates are already pre-adjusted and must not be reset.
- Clean input shaft splines and (in case of used clutch plates) clean hub splines, remove corrosion and apply

only a very thin coating of lubricant on splines. Do not grease the guide sleeve.

- If necessary, check centering of clutch drive plate.
- Check clutch release bearing for wear and replace if necessary.

If plastic ring of clutch release bearing is loose:

Fig. 107: Servicing Release Bearing With Plastic Ring
Courtesy of VOLKSWAGEN UNITED STATES, INC.

- Adhere clutch release bearing plastic ring to bearing ring, adhesive
- 3 rectangular tabs - **arrows** - of plastic ring reach into cutouts of bearing ring.
- If grooves with depth of more than 0.5 mm are present, the release bearing must be replaced.
- Make sure alignment sleeves for engine to transmission are installed in cylinder block. Install if necessary.
- Install intermediate plate between engine and transmission onto alignment bushings.
- Bolt transmission to engine.

NOTE:

- **Torque specifications only apply to lightly greased, oiled, phosphated or blackened nuts and bolts.**
- **Additional lubricants, such as engine or transmission oil are permissible, although lubricants containing graphite are not.**
- **Do not use any degreased parts.**
- **Tolerance for torque specifications $\pm 15\%$.**

The rest of installation is in reverse order of removal, note the following:

- Install front exhaust pipes with catalytic converters: Left --> **Left front exhaust pipe with primary and main catalytic converter (vehicles with manual transmission), removing and installing**, right --> **Right front exhaust pipe with primary and main catalytic converter (vehicles with automatic transmission), removing and installing**.
- Always clean threaded driveshaft bores in transmission flanged shaft of locking fluid residue using a tap before installation.

Engine (vehicles with automatic transmission), installing

NOTE:

- During assembly, replace self-locking nuts and bolts.
- Always replace bolts that are tightened to torque as well as sealing rings, gaskets and O-rings.
- Secure all hose connections using hose clamps appropriate for the model type .

- During installation, re-install all heat insulation sleeves at the same locations.
- During installation, all cable ties must be re-installed at the same location.

Fig. 230: Checking Installation Dimension For Torque Converter
Courtesy of VOLKSWAGEN UNITED STATES, INC.

Installation dimension for torque converter, checking

When torque converter is installed correctly, distance between contact surface of threaded holes at torque converter and contact surface of converter housing on Automatic Transmission 09L is approx. 19 mm.

CAUTION: If torque converter is incorrectly installed, torque converter coupling and ATF pump could be damaged when transmission and engine are flanged together.

Fig. 231: Torque Converter Bolts
Courtesy of VOLKSWAGEN UNITED STATES, INC.

- Before connecting engine and transmission, rotate torque converter and engine drive plate so that one hole or one threaded hole stands at height of opening of removed starter - **arrow** -.
- To secure torque converter to drive plate, use new original ribbed bolts .
- Bolt transmission to engine.

CAUTION: Keep checking whether the torque converter behind the drive plate can be turned before and during tightening of the bolts at engine/transmission flange. If the torque converter cannot be turned, it must be assumed that it has not been inserted properly and that the coupling plate of the ATF pump and therefore the transmission will be destroyed during final tightening of the bolts.

NOTE:

- Torque specifications only apply to lightly greased, oiled, phosphated or blackened nuts and bolts.
- Additional lubricants, such as engine or transmission oil are permissible, although lubricants containing graphite are not.
- Do not use any degreased parts.
- Tolerance for torque specifications $\pm 15\%$.

Camshaft timing chains, removing from camshafts

NOTE:

- For the removal of the cylinder head or camshafts, it is sufficient to remove camshaft timing chains only from the camshafts. Chains remain on the engine; only the top covers at left and right are removed.
- Even if work is performed only on one of the cylinder heads, the procedure described must be followed, since then the valve timing at both cylinder heads must be adjusted.

Installing

- Secure crankshaft in TDC position using Crankshaft Holder 3242.

NOTE:

- Always replace bolts that are tightened to torque as well as O-rings and gaskets.
- When turning camshaft, crankshaft must not be at TDC for any cylinder. Valves and/or pistons may be damaged.
- During installation, all cable ties must be re-installed at the same location.

Allocation of crankshaft bearing shells for cylinder block

- Bearing shells are allocated to cylinder block corresponding to color markings stamped into cylinder block.
- For used and reworked crankshafts, the main crankshaft journals must be measured in order to allocate matching bearing shells.
- Basic dimension of main crankshaft journals = 65 mm dia.

2004 Audi S4 Avant Quattro

ENGINE 4.2 Liter V8 5V Engine Mechanical, Engine Code(s): BHF

- Repair stage of main crankshaft journals = 64.75 mm dia.
- Thicker over-sized bearing shells are available for reworked crankshafts. These have the same color markings as the original-size bearing shells.

- Plastigage

Work procedure

NOTE:

- **Do not interchange used bearings**
- **Bearing shells that are worn down to the nickel layer must be replaced.**
- Remove guide frame and clean journals.
- Place Plastigage over entire width of bearing journal or into bearing shells.
- Plastigage must rest in center of bearing shell.
- Install guide frame and tighten to 30 Nm. Do not turn crankshaft.
- Remove guide frame again.

- Compare width of Plastigage with measuring scale:
 - Radial clearance, new: 0.010 to 0.039 mm.
 - Radial clearance wear limit: 0.08 mm.

- Remove cylinder head and place it on a soft surface (foam).

Installing

NOTE:

- Replace cylinder head bolts.
- During assembly, replace self-locking nuts and bolts.
- Always replace bolts that are tightened to torque as well as O-rings and gaskets.
- Carefully remove residual sealant from cylinder head and cylinder block. Make sure that no long scrapes or scratches result.
- Carefully remove all grinding and sanding residue.
- There must be no oil or coolant in the blind holes for the cylinder head

bolts in the cylinder block.

- After installing a replacement cylinder head with camshafts installed, oil contact surfaces between roller rocker levers and cam lubricating surfaces after installing cylinder head.
- Do not remove plastic bases protecting exposed valves until immediately before installing cylinder head.
- Cylinder heads with cracks between the valve seats, or between the valve seat and the spark plug threads, can continue to be used without reducing the service life, as long as the cracks have a width of max. 0.3 mm, or only the first 4 threads of the spark plug threads are cracked.
- Only unpack new cylinder head gasket immediately prior to installation.
- Handle gasket with extra care. Damages to the silicone layer and in areas of recesses may result in leaks.
- Install cylinder head gasket onto guide sleeves. Marking "oben" (top) or part number must face toward cylinder head.
- Secure all hose connections using hose clamps appropriate for the model type .
- When replacing the cylinder head or cylinder head seal, all of the coolant and engine oil must be replaced.
- After working on the valvetrain and lifters, carefully rotate the crankshaft by hand at least 2 full revolutions before starting to be sure that valves do not strike the pistons.
- During installation, all cable ties must be re-installed at the same location.

- Check whether camshafts of both cylinder heads stand in TDC position.

VALVETRAIN, SERVICING

Valvetrain, servicing

NOTE:

- Cylinder heads with cracks between the valve seats, or between the valve seat and the spark plug threads, can continue to be used without reducing the service life, as long as the cracks have a width of max. 0.3 mm, or only the first 4 threads of the spark plug threads are cracked.
- After installing the camshafts, the engine may not be started for approx. 30 minutes. The hydraulic equalization elements must seat themselves (otherwise the valves will crash into the pistons).
- After working on the valvetrain, carefully rotate engine by hand at least 2 full revolutions to ensure that valves do not strike the pistons when starting.
- Always replace seals, sealing rings and O-rings.

NOTE:

- After installing camshafts, do not crank engine for at least 30 minutes. The hydraulic equalization elements must seat themselves (otherwise valves will strike the pistons).
- After working on the valvetrain and lifters, carefully rotate the crankshaft by hand at least 2 full revolutions before starting to be sure that valves do not strike the pistons.

Valve guides, checking

Special tools, testers and auxiliary items required

Fig. 557: Identifying Dial Gauge Holder VW 387
Courtesy of VOLKSWAGEN UNITED STATES, INC.

- Dial gauge holder VW 387

- Dial gauge

Work sequence

Fig. 558: Identifying Special Tool - VW 387 Installed
Courtesy of VOLKSWAGEN UNITED STATES, INC.

- Insert valve into valve guide.
- Valve stem tip must seal with valve guide.

NOTE:

- Due to differences in valve stem diameter, make sure that only intake valves are used to check intake valve guides, and only exhaust valves are used to check exhaust valve guides.

- Determine tilt clearance.
- Wear limit of intake and exhaust valve guide: 0.80 mm.

NOTE:

- If wear limit is exceeded, re-measure using new valves.
- If wear limit is still exceeded, replace cylinder head. The valve guides cannot be replaced.
- If valve is replaced during repair, use new valve for measurement.

Valves, checking

- Perform a visual check for signs of wear at stem and at seating surface.
- Replace valves with significant traces of wear.

Valve dimensions

**Fig. 559: Valve Dimensions**

Courtesy of VOLKSWAGEN UNITED STATES, INC.

NOTE:

- Intake and exhaust valves must not be refaced by grinding. Only lapping is permitted.

Dimension	Intake valve	Exhaust valve
a = diameter mm	26.8 to 27.0	29.8 to 30.0
b = diameter mm	5.956 to 5.970	5.936 to 5.950
c = mm	96.39 to 96.59	94.79 to 94.99
a = Angle °	45	45

CAUTION:

- Worn sodium-filled exhaust valves must not be scrapped without first being properly treated.
- Using a metal saw, the valves must be cut in half between the shaft center and valve plate. While doing this, do not come into contact with water. After cutting open valves, throw not more than 10 at a time into a bucket of water. Then, move quickly away, because a sudden chemical reaction will occur during which the sodium is burnt away.
- The treated parts may then be discarded through conventional disposal channels.

Valve seats, refacing

NOTE:

- If a perfect contact pattern is not achieved by grinding the valve seats,

reface the valve seats.

Special tools, testers and auxiliary items required

- Depth gauge
- Valve seat refacing tool

NOTE:

- When repairing engines with leaking valves, it is not sufficient to rework or replace valve seats and valves. It is particularly important to check valve guides for wear on engines with higher mileage --> Valve guides, checking
- Only reface valve seats enough until a perfect contact pattern is obtained.
- Before refacing, determine maximum refacing dimension.
- If refaced dimension is exceeded, hydraulic valve lifter function is no longer guaranteed and cylinder head must be replaced.

Determining maximum allowable refacing dimension

- Insert valve and press it firmly against valve seat.

NOTE:

- If the valve is to be replaced as part of a repair, use a new valve for the calculation.

Fig. 560: Measuring Distance Between Valve Stem End (Upper Edge) And Top Surface Of Cylinder Head Using Depth Gauge

Courtesy of VOLKSWAGEN UNITED STATES, INC.

- Calculate maximum permissible refacing dimension from measured distance and the minimum dimension.

39.3 mm

41.0 mm

39.9 mm

Measured distance minus minimum dimension = max. permissible refaced dimension.

Example for outer intake valve:

	Measured distance	39.7 mm
	Minimum dimension	-39.3 mm
=	Maximum permissible refacing dimension	= 0.4 mm

NOTE:

- If the maximum allowed refaced dimension is 0 mm or less than 0 mm, repeat measurement using new valve. If measurement result is still 0 mm or less than 0 mm, replace cylinder head.

- **Determining maximum allowable refacing dimension Determining maximum allowable refacing dimension.**

Camshaft adjustment, checking

The adjustment of intake camshafts is load- and RPM dependent. Oil pressure is switched to respective camshaft adjuster (mechanical adjustment devices) via solenoid valve for camshaft adjustment.

NOTE:

- **Camshaft adjustment is active only 25 seconds after engine start.**

- Connect multimeter to valve for resistance measurement.
- Specification: 8 to 13 ohms.

If specification is not obtained:

- Replace valve.

If specified value is not achieved:

Checking voltage supply

- Fuse for valve for camshaft adjustment is OK --> Electrical Wiring Diagrams, Troubleshooting and Component Locations.
- Motronic Engine Control Module (ECM) Power Supply Relay J271 OK.

NOTE:

- **Voltage for camshaft adjustment valves is supplied via Motronic Engine Control Module (ECM) Power Supply Relay J271.**

- Connect voltage tester V.A.G 1527 B as follows:

Harness connector Terminal	Measure to
- 1 -	Engine Ground (GND)

- Operate starter briefly.
- LED must light up.

If LED does not light up:

- Check wire connection from terminal 1 of electrical harness connector via fuse to Motronic Engine Control Module (ECM) Power Supply Relay J271 for open circuit according to wiring diagram.
- Repair wire connection if necessary.

If LED lights up:

Check activation

Display on VAS 5051 :

- In selection - 1 - , click on the function "03 - output Diagnostic Test Mode (DTM)".
- Press --> button repeatedly until Camshaft Adjustment Valve 1 N205 is activated.
 - LED must blink.
- Press --> button repeatedly until Camshaft Adjustment Valve 2 N208 is activated.
 - LED must blink.
- End function "03 - output Diagnostic Test Mode (DTM)" by pressing <-- button.
- Select "06 - End Output".

- Switch off ignition.

If LED does not blink or it remains lit:

- Place old oil collecting and extracting device V.A.G 1782 under engine.
- Remove bolts - **arrows** - and remove oil cooler.

Installing

Installation is in reverse order of removal, note the following:

NOTE:

- **Replace O-rings.**
 - **Secure all hose connections using hose clamps appropriate for the model type .**
- When installing generator bracket, note the two alignment bushings.
 - Install generator -->

Special tools, testers and auxiliary items required

- Oil pressure gauge V.A.G 1342 with adapter V.A.G 1342/14
- Voltage tester V.A.G 1527 B
- Connector test set V.A.G 1594 C

Test conditions

- Oil level OK
- Engine oil temperature approximately 90 ° C.

- Install oil pressure switch - **2** - into oil pressure gauge V.A.G 1342.
- Place the brown wire of oil pressure gauge on Ground (GND).

Oil pressure switch, checking

- Connect voltage tester V.A.G 1527 B - **1** - with adapter cables from connector test kit V.A.G 1594 C to oil pressure switch and battery positive ("+").
- LED must not light up.

If LED lights up:

- Replace Oil Pressure Switch.
- Start engine.

NOTE:

- **While starting engine, watch Pressure Tester and LED as oil pressure switch may open during start.**
- **At 1.2 to 1.6 bar pressure, LED must light up.**

If LED does not light up:

- Replace Oil Pressure Switch.

Oil pressure, checking

- Start engine.
- Oil pressure at 2000 RPM: min. 2.0 bar
- Oil pressure at 3500 RPM: min. 3.5 bar

Oil level, checking

- NOTE:**
- Oil level must not exceed max. marking danger of catalytic converter damage!

Test conditions

- Engine oil temperature min. 60 ° C.
- Vehicle in level position.
- After stopping engine, wait a few minutes to allow oil to flow back into oil pan.

Test sequence

- Pull out oil dipstick, wipe off with a clean cloth and re-insert dipstick again up to stop.
- Withdraw dipstick again and read oil level.

Range of markings on dipstick:

- a - Oil must not be added.
- b - Oil may be topped off.
- c - Oil must be added. After topping off, it is sufficient if oil level is somewhere in range - b - (shaded area).

- NOTE:**
- Oil level must not exceed max. marking - a - and must not fall short of min. marking - c -.

- Hose clamp pliers V.A.G 1921
- Cooling system charge unit VAS 6096

- Drip tray for workshop crane VAS 6208
- Refractometer T10007

Draining

NOTE: • Drained coolant must be stored in a clean container for disposal or reuse.

CAUTION: Cover cap of expansion tank with rag and open carefully, as hot steam i.e. hot coolant may escape when opening.

- Open cap of coolant expansion tank.

- Remove drain plug - **arrow** - on coolant thermostat housing and drain coolant from engine.

Filling

NOTE:

- The cooling system is filled all year round with a mixture of frost and corrosion protection additives and water.
- Use only *coolant additive Plus G 012 A8F A1* (short: G12+) "according to TL VW 774 F". Other coolant additives may above all reduce the corrosion protection effect significantly. The damage resulting from this may lead to loss of coolant and consequently to severe engine damage.
- G12+ and coolant additives with the designation "according to TL VW 774 F" reduce frost and corrosion damage as well as lime deposits. They also raise the boiling point. For this reason the system must be filled all year round with frost and corrosion protection additives.
- Because of its high boiling point, the coolant improves engine reliability under heavy loads, particularly in countries with tropical climates.
- Protection against frost must be assured to about -25 ° C (in arctic climatic countries to about -35 ° C).
- The coolant concentration must not be reduced by adding water even in warmer seasons and in warmer countries. The coolant additive portion must be at least 40%.
- If for climatic reasons greater frost protection is required, the amount of G12+ can be increased, but only up to 60% (frost protection to about -40 ° C), otherwise frost protection and cooling effectiveness will be reduced.

- Only clean drinking water may be used for mixing coolant.
- If the radiator, heater core, cylinder head and cylinder head gasket or cylinder block is replaced, completely replace the engine coolant.
- Dirty coolant must not be re-used.
- For coolant G12+ , use refractometer T10007 to test frost protection in cooling system.

Fig. 639: Removing Drain Plug On Coolant Thermostat Housing

- Re-install drain plug - **arrow** - with new sealing ring.

Fig. 640: Filling Reservoir VAS 6096/1 With At Least 12 Liters Of Premixed Coolant
Courtesy of VOLKSWAGEN UNITED STATES, INC.

- Fill coolant reservoir of Cooling System Charge Unit VAS 6096 with at least 12 liters of pre-mixed coolant with correct mixture ratio:
 - G12+ (40%) and water (60%) for frost protection up to -25 ° C
 - G12+ (50%) and water (50%) for frost protection up to -35 ° C
 - G12+ (60%) and water (40%) for frost protection up to -40 ° C

- Install adapter V.A.G 1274/8 onto expansion tank.
- Assemble Cooling System Charge Unit VAS 6096 on adapter V.A.G 1274/8.
- Place air outlet hose - **1** - into a small container - **2** -. (A small amount of coolant is drawn off which should be reserved with the discharged air.)
- Close both valves - **A** - and - **B** - , turn lever perpendicular to direction of flow to do this.
- Connect hose - **3** - to pressurized air.
- Pressure: 6 to 10 bar positive pressure.

Fig. 641: Opening Valve

Courtesy of VOLKSWAGEN UNITED STATES, INC.

- Open valve - **B** - , to do this, turn lever in direction of flow.

A vacuum is created in cooling system by suction jet pump.

- Needle on instrument display must travel into green region.
- Also briefly open valve - **A** - , turn lever in direction of flow to do this, so that coolant reservoir hose of cooling system filler unit VAS 6096 is filled with coolant.
- Close valve - **A** - again.
- Let valve - **B** - remain open another 2 minutes.
- A further vacuum is created in cooling system by suction jet pump.
- Needle on instrument display must still remain in green region.
- Close valve - **B** -.
- Needle in the display instrument must remain in green region, then sufficient vacuum in cooling system is obtained for the upcoming filling.

If needle stands below the green region, repeat procedure.

If vacuum decreases, cooling system is leaking.

- Disconnect pressurized air hose.
- Open valve - A -.

The vacuum in cooling system has effect of extracting coolant from coolant reservoir of VAS 6096 ; cooling system is filled.

- Detach cooling system filler unit VAS 6096 from adapter V.A.G 1274/8 on coolant expansion tank.

- Slide back boot for coolant hoses at connection of heater core.
- Loosen coolant hose to heater core and pull back hose sufficiently so that the bleeder hole - **arrow** - is no longer sealed by connection.
- Fill up coolant until it escapes from the coolant hose bleeder hole without bubbles.
- Push coolant hose on connection and tighten.
- Twist cap for expansion tank closed.
- Start engine.
- Set heating air conditioning system to "HI".
- Let engine run at 2000 RPM for 3 minutes.
- Let engine run at idle long enough until both large coolant hoses on main cooler are warm.
- Let engine run at 2000 RPM for 1 minute.
- Turn off engine and allow it to cool off.

Special tools, testers and auxiliary items required

- Cooling system tester V.A.G 1274
- Adapter V.A.G 1274/8
- Adapter V.A.G 1274/9

Test conditions

- Engine at operating temperature.

Test sequence

CAUTION: Cover cap of expansion tank with rag and open carefully, as hot steam i.e. hot coolant may escape when opening.

- Open cap of coolant expansion tank.

Fig. 726: Positioning Cooling System Tester V.A.G 1274 With Adapter V.A.G 1274/8 On Expansion Tank

- Position cooling system tester V.A.G 1274 with adapter V.A.G 1274/8 on expansion tank.
- Generate a positive pressure of approx. 1.0 bar using hand pump of cooling system tester.

If pressure drops:

- Search for leaking areas and repair malfunction.

Pressure relief valve in cap, checking

- Position cooling system tester V.A.G 1274 with adapter V.A.G 1274/9 on cap.
- Generate a positive pressure using hand pump of cooling system tester.
- Pressure release valve must open at a positive pressure of 1.4 to 1.6 bar.

If check-valve does not open as indicated:

- Replace cap.

Electric coolant fan, function

Cooling system is equipped with 2 electric coolant fans:

- Coolant Fan V7 at left in direction of travel with Coolant Fan Control (FC) Control Module J293
- Coolant Fan 2 V177 at right in direction of travel with Coolant Fan Control (FC) Control Module 2 J671

Both fans are activated continuously via respective Coolant Fan Control (FC) Control Module.

- Terminal 66 of Engine Control Module (ECM) is the control output to Coolant Fan Control (FC) Control Module J293.
- Terminal 104 of Engine Control Module (ECM) is the control output to Coolant Fan Control (FC) Control Module 2 J671.

Coolant fans are activated by reason of the following criteria:

- Fan request from A/C system: A fan request is transmitted by A/C control head via CAN-Bus to Engine Control Module (ECM), it is sent directly to the fans.
- Normal engine operation: During normal driving operation and engine running at idle, fans are regulated by coolant temperature and ambient temperature.

Special tools, testers and auxiliary items required

- Hand multimeter V.A.G 1526 B or V.A.G 1526 A
- Voltage tester V.A.G 1527 B
- Connector test kit V.A.G 1594 C or V.A.G 1594 A
- Test box V.A.G 1598/31
- Vehicle Diagnostic, Testing and Information System VAS 5051 with diagnostic cable VAS 5051/1

Work sequence

- Connect Vehicle Diagnostic, Testing and Information System VAS 5051 A and select vehicle system "01 - engine electronics". For this, ignition must be switched on Guided Fault Finding in VAS 5051.

- Press --> button repeatedly, until "coolant fan activation 1" is activated.
- Coolant Fan Control (FC) Control Module J293 switches on Coolant Fan V7 (left) 1 time slowly to full speed.
- End function "03 - output Diagnostic Test Mode (DTM)" by pressing <-- button.

If fan activation does not react as described:

- Produce conditions for starting up coolant fan according to required input criteria (e.g. switch on A/C system, increase engine temperature correspondingly).

Exhaust system components, removing and installing

NOTE:

- Replace gaskets and self-locking nuts.
- During installation, protective heat boots must be re-installed at the same location.
- All cable ties opened or cut during engine removal must be reinstalled at the same locations during installation.
- After exhaust system repairs, make sure exhaust system is not under stress and is far enough from the body. If necessary, loosen double clamps and align mufflers and exhaust pipes so that there is adequate distance to vehicle body, and weight is evenly distributed among the exhaust hangers.
- Flex joint in front exhaust pipe must not be bent more than 10 ° , otherwise it may be damaged.

- Start engine and let run at idle.
- Seal tailpipes with cloths or plug for duration of the leak test.
- Check for leaks by listening at connection areas of cylinder head/exhaust manifold, exhaust manifold/front exhaust pipe etc.
- Repair leaks detected.

SECONDARY AIR INJECTION (AIR), SERVICING

Secondary Air Injection (AIR), servicing

The Secondary Air Injection (AIR) system heats up the engine faster, and thereby the catalytic converter achieves operation readiness earlier after a cold start.

Principle and function

Principle

Due to the rich mixture during the cold start phase, the exhaust emissions contain an increased level of unburned hydrocarbons. The Secondary Air Injection (AIR) system improves the secondary oxidation within the catalytic converter, thereby reducing harmful emissions. The heat released by secondary oxidation shortens the start-up time of the catalytic converter considerably, as well as significantly improves emissions quality during the cold-running phase.

Function

Fig. 859: Secondary Air Injection (Air), Component Overview
Courtesy of VOLKSWAGEN UNITED STATES, INC.

- In the cold start phase, the ECM - **3** - activates secondary air pump - **1** - via relay for secondary air pump - **2** -. Air reaches combination valves for Secondary Air Injection (AIR) - **4** - and - **8** -.
- The Secondary Air Injection (AIR) valve - **5** - is activated in parallel, which allows the vacuum to reach the combination valves for Secondary Air Injection (AIR) - **4** - and - **8** -. The appropriate combination valve for Secondary Air Injection (AIR) thereby opens the path for secondary air to the exhaust channels of the cylinder head.
